Side Tabs

The side tabs highlight where you are in each protocol sub-section

The BLUE highlighted text shows which sub-section you are currently viewing

The GREY text shows the sub-sections before and after your current selection

If viewing this document as portable document file (.pdf / Adobe Acrobat)

This document is hyperlink for easy navigation in Adobe Acrobat.

The colored boxes in each protocol tree are linked to the respective pages with further information on the specific procedure, medication, or protocol page. There is an active link when hovering over the text within the colored box and the cursor changes from a bar to a pointer finger. Left clicking will jump to the linked page containing further information. Right clicking and selecting “Previous View” will return you to the page you started at.

This document is also bookmarked with respect to the individual sections. Use the bookmark feature of Adobe Acrobat to display pre-designated bookmarks and click on each to jump between sections.
KEY TO ALGORITHMS

All algorithms are color coded to denote procedures, which may be performed by each level of certification. To perform procedures color-coded red, Online Medical Control must be contacted for permission. Higher levels of certification will perform lower-level evaluations and procedures when interpreting the algorithms.

The protocol format is for quick reference and does not detail patient assessment, interpretation, or interventions. EMS personnel are accountable for all patient care and documentation to their level of training and lower.

</table>

Stop – Do NOT perform intervention if listed criteria are present. Discuss with Online Medical Control if provider feels there is therapeutic value despite the stop.

Caution – Reminder about specific intervention. Do NOT perform action unless listed criteria are met and understood. If question(s), contact Online Medical Control

Time sensitive – Requires timely response by providers within timeframe indicated
ACKNOWLEDGEMENTS

The Cuyahoga County EMS Protocol Committee shall ensure quality pre-hospital care is provided to all citizens and visitors of Cuyahoga County and the Northeast Ohio region. Through a unified medical systems approach, all pre-hospital providers will have access to the same Emergency Medical Service (EMS) pre-hospital treatment protocols, allowing a seamless transition of patient care from pre-hospital providers to hospital Emergency Departments regardless of system affiliation.

Special recognition is provided to the Committee members involved in the development of this protocol document. The following individuals and agencies participated in the development process of this document:

INTRODUCTION
The Northeast Ohio Regional EMS Protocols were created by the collaborative efforts of local EMS leaders with the support of specialized physicians and pharmacists to provide a unified application of pre-hospital patient care. These protocols are available online for public review at http://www.cecoms.cuyahogacounty.us/EMSProtocol.aspx. This is the most current and the only official active version. We hereby freely share and permit any outside agency to use these protocols or portions thereof, but they shall not be copyrighted without written permission from all members of the committee.

The committee appreciates all feedback forms and will consider all suggestions to improve clarifications and make corrections as needed. Regular meetings will be held to incorporate updates and utilize evidence-based medicine whenever applicable. The committee does not endorse any brand or product mentioned herein and reserves the right to make changes accordingly.

These protocols and procedures are to be used as guidelines for operation during EMS calls that require medical direction. They are also intended to be guidelines to ensure that personnel are trained in proper pre-hospital patient care.

Procedures are not considered rigid rules, but rather established standards against which EMS practice can be measured.

Treatment protocols are specific orders directing the actions pertaining to techniques and/or medications used by EMS personnel who are required to practice under supervision of a physician and under their respective EMS Medical Control authority. Treatment protocols may and should be initiated without prior direct Online Medical Control contact, especially when the patient’s condition and/or situation is life threatening.

Although not identical, these protocols and procedures are derived from the State of Ohio EMS guidelines. Please note that items in this manual are subject to continuous review for the sake of providing members with the most current emergency medical information. Updates to this material may be frequent to maintain a current standard of care to benefit both the patient and the provider of emergency medical care. Please replace older versions with newly updated material as soon as it is issued. Once updated, older versions are to be considered obsolete and are to be discarded to help eliminate confusion.

ONGOING IMPROVEMENT
In an effort to assure these protocols remain relevant and up to date, an email form specific to the ongoing management of this document has been created. Anyone with ideas for improvement should go to http://cecoms.cuyahogacounty.us/EMSProtocol.aspx and use the feedback form for their suggestions. If there are specific questions about intent, meaning, or interpretation of the protocols, these should be directed to one’s EMS coordinator or Medical Director.

The above listed email will serve as a singular collection point for all corrections, and suggestions. Please understand that protocol changes are an ongoing, progressive, process requiring involvement of many parties to bring to print. Not all suggestions can or will be used, but all will be reviewed by the protocol committee and the Medical Directors. We look forward to your suggestions and corrections to assure that we field the finest pre-hospital care protocol.
INTRODUCTION

MEDICAL CONTROL GENERAL GUIDELINES

1. The patient history should not be obtained at the expense of the patient. Life-threatening problems detected during the primary assessment must be treated first.

2. Cardiac arrest due to trauma is not treated by medical cardiac arrest protocols. Penetrating trauma patients should be transported promptly with CPR, control of hemorrhage, cervical spine immobilization, and other indicated procedures attempted enroute.

3. In patients with non-life-threatening emergencies who require IV's, only two attempts at IV insertion should be attempted in the field; additional attempts must be made enroute.

4. In patients requiring IV's, as a courtesy to the patient and emergency department, attempts should be made to obtain a full set of lab work. A patient IV should not be compromised to obtain a set of lab work.

5. Patient transport, or other needed treatments, must not be delayed for multiple attempts at endotracheal intubation. Limit to two attempts pre-hospital.

6. Verbally repeat all orders received before their initiation.

7. Any adult medical patient or patients of any age with a cardiac history, irregular pulse, unstable blood pressure, dyspnea, chest pain, must be placed on a cardiac monitor.

8. Where clinically indicated, obtain a 12-lead EKG, and transmit to the emergency department. The transmission must include the patient’s name, age, and sex.

9. When transferring lower-level prehospital care to a higher level of prehospital care, a thorough consult should be performed between caregivers describing initial patient presentation and care rendered to the point of transfer.

10. If the patient’s condition does not seem to fit a protocol or protocols, contact Online Medical Control for guidance.

11. All trauma patients with a mechanism or history for multiple system trauma should be transported as soon as possible. The scene time should be 10 minutes or less.

12. Medical patients will be transported in the most efficient manner possible considering the medical condition. Advanced life support therapy should be provided at the scene if it would positively impact patient care. Justification for scene times greater than 20 minutes should be documented.

Online Medical Control
Universal Patient Care Key Points

- Any patient contact, whether it results in an EMS transport or not, must have a completed PCR.
- Exam: Minimal exam if not noted on the specific protocol is vital signs, mental status, and location of injury or complaint.
- Required vital signs on every patient include BP, pulse, respirations, and pain scale.
- A pediatric patient is defined by the weight-based system. If the patient does not fit on the system, they are considered adult.
- Timing of transport should be based on patient’s clinical condition and the transport policy.

General
- All patient care and documentation MUST be appropriate for your level of training and within the standard of care of the State of Ohio.
- Minimize over-ventilation. Ventilate Adults 1 breath every 6 seconds (10 breaths / min) with BVM or advanced airway. Ventilate pediatrics 1 breath every 2 - 3 seconds (20 – 30 breaths / min) with or without and advanced airway.
- Refer to the Post Resuscitation Cardiac Arrest Protocol for all resuscitated cardiac arrest patients.
- One provider can begin resuscitation and treatment while the other performs the assessment.
- It may be necessary to reference several protocols while treating a patient.
- Refer to the appropriate protocol and provide the required interventions as indicated.
- Additional focus may be needed in specific areas as indicated by the patient’s chief complaint.
- Airway management and oxygen administration should be initiated based upon the results of the patient assessment and the protocols.
- IV’s should be initiated in all patients based upon the results of the patient assessment and the Intravenous Access Procedure. Attempt to draw blood samples whenever an IV is initiated. However, do not jeopardize the IV for the blood samples.
- IV’s are generally preferred over IO access. Attempts should be made to establish IV’s. If IO access is necessary, humeral head IO’s offer greater flow rates and are preferred over tibial IO. Other clinical factors should be considered when deciding any vascular access, as they may dictate delivery of care.
- Administer cardiac monitoring and perform a 12-Lead EKG based upon the results of patient assessment or protocols.
- EMT and Advanced EMT’s may apply the cardiac monitor, print a strip, and transfer the strip to the emergency department but may not interpret the rhythm.
- If indicated and possible, perform a 12-Lead EKG before moving to the squad and prior to any medication administration.
- Check the patient’s Blood Glucose Level based upon the patient’s assessment and the protocols.
- When assessing for pain, use a 0-10 pain scale; 0 = no pain; 10 = worst pain ever experienced.
- It is mandatory to document the reason why an intervention was not performed if it was indicated.
- If Online Medical Control requests that a functioning paramedic perform an intervention outside of the protocol, the functioning paramedic may follow the orders if ALL of the following apply:
  o The patient’s condition could be severely affected if the intervention is not performed.
  o The paramedic has documented training in the intervention within the last 3 years.
  o The intervention is in the recognized scope of practice for paramedics in the state of Ohio.
  o The paramedic has received permission to perform the intervention from Online Medical Control.
  o Online Medical Control was notified that the intervention is not in the protocol.

Adult
- Patients who are taking rate control medications may not have an elevated heart rate, but may still be in shock.
- General weakness can be a symptom of a life threatening illness.
- Hip fractures and dislocations in the elderly have a high mortality rate.
- What would be considered a minor or moderate injury in the adult patient can be life threatening in the elderly.
- Diabetic patients may have abnormal presentations of AMI and other conditions due to neuropathy.
- A medical cardiac arrest is not a “load and go” situation. It is in the best interest of the patient to perform all initial interventions (Defib, CPR, ETT, IV) and 1-2 rounds of medications prior to transport.
- An adult patient is considered hypotensive if their systolic BP is 90 mmHg or less or a MAP < 65.
- Assess the patient after every 250 ml of normal saline, and continue with fluid resuscitation until it is no longer indicated.

Pediatric
- Assess the pediatric patient after every fluid bolus of normal saline, and continue with fluid resuscitation until it is no longer indicated.
- Refer to the Pediatric Intraosseous Procedure, if indicated.
- It may be necessary to alter the order of the assessment (except for the Initial Assessment) based upon the developmental stage of the patient.
- A pediatric trauma patient is any trauma patient who is less than 16 years old.
- Refer to the Pediatric Vital Signs Chart, as needed.
## SECTION 1 - TABLE OF CONTENTS

### 1. INTRODUCTION

- Navigation .......................................................... 2-1

## 15. APPENDIX # 3 : MEDICAL CONTROL

### OVERVIEW
- Regional Protocol Participation .................................................................................. 2-15
- EMS Levels of Certification ......................................................................................... 3-15
- EMS Recertification Requirements ............................................................................... 4-15

### OPERATIONS
- EMS Communications .................................................................................................. 5-15
- EMS Documentation ................................................................................................... 6-15
- Emergency Department Restrictions ........................................................................... 7-15

### GUIDELINES / PROCEDURES
- Advanced Directives - Do Not Resuscitate (DNR) Orders .............................................. 8-15
- Aeromedical Transport ............................................................................................... 10-15
- Alternate Transport Guidelines ................................................................................... 12-15
- Bed Bugs ..................................................................................................................... 13-15
- Children with Special Healthcare Needs ..................................................................... 14-15
- Child / Adult / Elder - Domestic Violence / Sexual Assault / Trafficking ..................... 15-15
- Concealed Weapons Guidelines .................................................................................. 17-15
- Consent and Refusal of Care Guidelines .................................................................... 18-15
- Crime Scene Guidelines ............................................................................................. 21-15
- Dead on Arrival (DOA) ............................................................................................... 23-19
- Health Insurance Portability and Accountability Act (HIPAA) ..................................... 23-15
- Newborn Abandonment .............................................................................................. 24-15
- Obese Patients ............................................................................................................ 25-15
- On - Scene EMT / Nurse / Physician Intervener .......................................................... 26-15
- School Bus Accidents .................................................................................................. 27-15
- Termination of Resuscitation Efforts .......................................................................... 28-15

### INFECTION CONTROL
- EMS Bloodborne Pathogen Exposure Guidelines ......................................................... 29-15

### ADMINISTRATION
- Blood Collection for Evidence ..................................................................................... 36-15
- Department Supplied Medical Equipment .................................................................... 37-15
- Drug Box Exchange ..................................................................................................... 38-15

## 16. APPENDIX # 4 : ODPS SCOPE OF PRACTICE

- Scope of Practice Introduction ...................................................................................... 1-16
- Procedure Matrix ......................................................................................................... 2-16
- Pre-Existing Medical Devices ....................................................................................... 6-16
- First Aid for Animals ..................................................................................................... 6-16
- Interfacility Transport .................................................................................................... 8-16
- Transmission of 12 Lead EKG's .................................................................................. 10-16

Northeast Ohio Regional EMS Protocol - 14 | 1
AIRWAY / BREATHING PROTOCOLS

Airway / Breathing Guidelines ................................................................. 2-2
Airway Adjuncts .................................................................................. 3-2
Airway .................................................................................................. 4-2
Congestive Heart Failure (CHF) & Pulmonary Edema ...................... 6-2
Foreign Body Airway Obstruction (FBAO) ........................................... 8-2
Rapid Sequence Intubation ................................................................. 10-2
Respiratory Distress ........................................................................... 12-2
Traumatic Breathing .......................................................................... 14-2
ADULT PROTOCOL
AIRWAY / BREATHING GUIDELINES

GUIDELINES OF AIRWAY / BREATHING ASSESSMENT

PARTIAL OBSTRUCTION
- May include coughing with some air movement. Give 100% Oxygen and encourage the patient to cough. Monitor for changes. Transport immediately and be prepared for a total obstruction to develop.

FOREIGN BODY AIRWAY OBSTRUCTIONS (FBAO)
- Should be removed immediately if able. Visualize airway and either suction or sweep out liquids and other materials. Solids must be hooked with an instrument. A laryngoscope may be used for direct visualization of the airway. If unable to clear airway by these methods, use Heimlich maneuver and abdominal or chest thrusts as appropriate.

STRIDOR
- High pitched crowing sound caused by obstruction of the upper airway.

WHEEZING
- A whistling or sighing sound, usually lower airway and found upon expiration.

RALES
- Fine to coarse crackles representing fluid in the lower airway.

RHONCHI
- Coarse upper airway sound representing various levels of upper airway obstruction.

COPD
- Pulmonary disease (as emphysema or chronic bronchitis) that is characterized by chronic typically irreversible airway obstruction resulting in prolonged exhalation.

CROUP
- Inflammation, edema, and subsequent obstruction of the larynx, trachea, and bronchi especially of infants and young children that is typically caused by a virus and is marked by episodes of difficulty breathing and hoarse metallic cough.

EPIGLOTTITIS
- Inflammation of the epiglottis usually caused by HIB microbes, now uncommon in children.

MANAGEMENT OF TRACHEOSTOMY PATIENTS

Tracheostomies come in 2 types
- Cuffed tracheostomy – has a distal cuff to create seal in patient trachea. Necessary for patients requiring mechanical ventilation. There is a ET tube like pilot balloon to verify cuff patency once placed in the tracheal stoma. Select devices may be filled with saline rather than air, this is device specific. Nearly all will be filled with air.
- Uncuffed tracheostomy – does not have distal cuff and does not seal in the trachea. This type is used for spontaneously breathing patients who require an alternate airway due to upper airway defect. These patients may be able to speak with the use of special tracheostomies or valves.

Tracheostomies have 2 essential parts
- Outer cannula – This is the base that secures in the tracheal stoma. If it is cuffed tracheostomy, the cuff is on this section. There are “wings” that allow for attachment of a tie around the patient’s neck. Some recently placed devices may be sutured in place.
- Inner cannula – is removable for cleaning / replacement. Usually clips or is locked in with a quarter turn detent.

Management of tracheostomy patients
- Have suction equipment on hand throughout all phases of treatment and transport suction to maintain patency as required.
- If a tracheostomy becomes dislodged and cannot be reinserted, use a ET tube sized to the stoma size.
- If a tracheostomy comes out and can be reinserted or needs changed, utilize a bougie (tube changer) if available to insert into stoma and “railroad” the tracheostomy over the bougie into place.
- Check all cuffed tracheostomy cuffs for patency, add additional air if an air leak can be appreciated around stoma.
- If a tracheostomy patient cannot be bagged effectively suspect mucous plug. Alternate trachea lavage with saline, suction, and bagging until resolved.
- If a tracheostomy patient presents with increased work of breathing, remove and inspect inner cannula.
- Pediatric tracheostomies may not have inner cannulas due to their size
- Take an extra tracheostomy kit or inner cannula with you during transport if available at pickup location
- Patients and their care givers are frequently very adept at managing these devices, utilize them as a resource
- See procedures section for stoma and tracheostomy care procedures

KEY POINTS

Airway Assessment:
- If you don’t have an airway – you don’t have anything!
- C-spine precautions must be considered prior to the insertion of airway adjuncts. Provide manual stabilization prior to insertion.
- See PEDIATRIC Section for pediatric airway management.

Breathing Assessment:
- Be sure that the airway is open before assessing breathing.
- When assessing breathing, observe rate, quality, depth, and equality of chest movement.
- COPD patients maintain on low flow oxygen (usually <2 L which keeps their O2 Sat in the 90’s%), and some may stop breathing on high flow. However - if the COPD patient needs high flow oxygen - it should be given. Be prepared to support breathing with BVM if needed.
- Always record vital signs when treating breathing problems.

ADULT PROTOCOL

AIRWAY

UNIVERSAL PATIENT CARE PROTOCOL
Assess ABC’s Respiratory Rate, Effort, and Adequacy

Adequate
Consider Supplemental OXYGEN

Inadequate
BASIC MANUVERS FIRST
Open airway
Nasal / Oral Airway
Bag-Valve-Mask

Patent Airway
CAPNOGRAPHY PROCEDURE Required
Consider Sedation Prior To Advanced Airway Placement
IF RESPONDS TO PAIN
KETAMINE (KETALAR) 1 - 2 mg / kg IV / IO
OR
MIDAZOLAM (VERSED)
2.5 mg IV / IO or 5 mg IM / IN
OR
LORazepam (ATIVAN)
1 – 2 mg IV / IO / IM / IN

Obstructed Airway
SEE FOREIGN BODY AIRWAY OBSTRUCTION PROTOCOL

Direct Laryngoscopy
Attempt Removal with Magill Forceps

CRICOTHYROTOMY
NEEDLE, KIT, or SURGICAL
As provided and trained
STOP Must Have Prior Medical Control Training / Approval

Capnography Procedure Required

INTUBATION PROCEDURE
Apply nasal cannula 15 LPM during intubation attempts

Max 2 Intubation Attempts
AEMT Apneic Patient Only
Document Failed Attempt(s)

Extralottic (BIAD) AIRWAY Device
No Medications Down Extralottic (BIAD) Airway
EMT Use in Pulseless & Apneic Patient Only
Esophageal Disease

Additional Sedation Required
After Advanced Airway Placement - Consider
MIDAZOLAM (VERSED)
2.5 mg IV / IO or 5 mg IM / IN
OR
LORazepam (ATIVAN)
1 – 2 mg IV / IO / IM / IN

Head Trauma
If Midazolam (Versed) or Lorazepam (Ativan) Unavailable, See Medication Section for Diazepam (Valium)

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

## Airway

### Indications
- Apnea
- Coughing
- Choking
- Inability to speak
- Unresponsive
- Burns
- Trauma

### Signs and Symptoms
- Witnessed aspiration
- Sudden episode of choking
- Gagging
- Audible stridor
- Change in skin color
- Decreased LOC
- Increased or decreased Respiratory rate
- Labored breathing
- Unproductive cough

### Differential Diagnosis
- Cardiac arrest
- Respiratory arrest
- Anaphylaxis
- Esophageal obstruction

---

**Extraglottic airway device / BIAD (Blind Insertion Airway Device)**
Examples (not limited to); King Airway, LMA, Combitube, iGel

**Differentiate airway obstruction from esophageal obstruction.**
If esophageal obstruction, place patient in position of comfort, suction as needed and treat pain.

---

### Key Points
- **Advanced EMT’s may only intubate pulseless or apneic patients.**
- **EMT may only place extraglottic (BIAD) airways in pulseless and apneic patients.**
- Capnography is mandatory with all methods of intubation. Document results.
- Maintain C-spine immobilization for patients with suspected spinal injury.
- Do not assume hyperventilation is psychogenic - use oxygen, not a paper bag.
- Sellick’s maneuver should be used to assist with difficult intubations.
- Paramedics should consider using an extraglottic (BIAD) airway if they are unable to intubate. Consider c-collar to maintain ETT placement for all intubated patients to maintain tube.
- Consider the use of intubation aids such as a bougie or video laryngoscope to facilitate intubation.
- Ketamine use in pregnancy is a risk / benefit assessment per case. Consult Medical Direction if there are questions.
CONGESTIVE HEART FAILURE (CHF) / PULMONARY EDEMA

UNIVERSAL PATIENT CARE PROTOCOL

12 LEAD EKG PROCEDURE
   ▶ 1st Patient Contact to EKG <10 Min

IV / IO PROCEDURE

Mild
   Adequate BP
   Apply OXYGEN 100%
   NITROGLYCERIN (NITRO-STAT / GoNitro) 0.4 mg (400 mcg) SL
   SBP <110
   Erectile Dysfunction / Pulmonary Hypertension Drug Within 48 Hrs.
   Consider CPAP PROCEDURE
   ▶ Hypotension
   ▶ Untreated Vomiting
   Monitor and Reassess

Moderate / Severe
   Adequate BP
   Apply OXYGEN 100%
   CAPNOGRAPHY PROCEDURE
   NITROGLYCERIN (NITRO-STAT / GoNitro) 0.4 mg (400 mcg) SL
   Repeat up to 3
   SBP <110
   Erectile Dysfunction / Pulmonary Hypertension Drug Within 48 Hrs.
   CPAP PROCEDURE
   ▶ Hypotension
   ▶ Untreated Vomiting
   If Wheezing
   DUONEB (ALBUTEROL / IPRATROPIUM)
   ▶ EMT use only with ONLINE Medical Control
   Monitor and Reassess

Cardiogenic Shock Hypotensive
   SBP < 90 and NO RADIAL PULSES
   Pale, cool, clammy, hypotensive, acute MI in progress, severe pulmonary edema
   Do NOT Give Vasodilators
   Do NOT Apply ITD
   May consider application of CPAP with concurrent fluid bolus

   OXYGEN 100%
   Bag – Valve Mask
   Gentle Ventilation
   Refer to Cardiogenic Shock Protocol

   EPINEPHrine (Adrenaline)
   PUSH DOSE
   Make 10 mcg / ml
   10 mcg (1 ml) every 2 - 5 min - slow push
   Titrate to effect
   To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable
   Consider Intubation Once BP Corrected

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

</tbody>
</table>

### History

- Congestive heart failure
- Past medical history
- Medications Ex. Digoxin (Lanoxin), Furosemide (Lasix)
- Erectile dysfunction medication use
- Cardiac history - past myocardial infarction
- Patient > 75 years old

### Signs and Symptoms

- Respiratory distress, bilateral rales
- Apprehension, orthopnea
- Jugular vein distention
- Pink, frothy sputum
- Diaphoresis
- Hypotension, shock
- Chest pain
- Positive hepatojugular reflux (HJR)
- Orthopnea

### Differential Diagnosis

- Myocardial infarction
- Congestive heart failure
- Asthma
- Anaphylaxis
- Aspiration
- COPD
- Pleural effusion
- Pneumonia
- Pulmonary embolus
- Pericardial tamponade

### Differentiate CHF vs. Pneumonia

**Congestive Heart Failure Signs and Symptoms**

- Afebrile
- Jugular venous distension (JVD)
- Positive hepatojugular reflux (HJR)
- Bilateral rales
- Distal edema
- Orthopnea
- History of CHF

**Pneumonia Signs and Symptoms**

- Febrile
- Cough
- History of infectious illness
- Unilateral rales
- No distal edema
- No jugular venous distension (JVD)
- No hepatojugular reflux (HJR)

### Key Points

- Exam: Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Obtain 12-lead EKG to evaluate for M.I.
- Differentiate and document CHF vs. pneumonia.
- Monitor for hypotension after administration of Nitroglycerin (Nitro-Stat / GoNitro).
- Monitor for hypotension while using CPAP, specifically with Nitroglycerine (Nitro-Stat / GoNitro).
- DO NOT administer Nitroglycerin (Nitro-Stat / GoNitro) to a patient who took an erectile dysfunction (ED) medication; Sildenafil (Viagra), Tadalafil (Cialas), Vardenafil (Levitra), etc. or pulmonary hypertension medication (PHTN) within the last 48 hours. Ask all patients.
FOREIGN BODY AIRWAY OBSTRUCTION (FBAO) - ADULT

UNIVERSAL PATIENT CARE PROTOCOL

Head Tilt / Chin Lift / Jaw Thrust
Airway Maneuvers

Coughing Conscious
- Encourage Patient to Cough
- OXYGEN
  10 – 15 L NRB

Complete Obstruction Conscious
- Abdominal Thrusts

Complete Obstruction Unconscious
- Visualize
- Remove Obvious Obstructions
- Open Airway / Rescue Breathing
- Chest Thrusts
- If unable to ventilate, reposition head and attempt again
- If unable to ventilate, continue sequence
- Direct Laryngoscopy
- Attempt Removal with Magill Forceps
- If unable to remove obstruction
- CRICOTHYROTOMY NEEDLE, KIT, or SURGICAL
  As provided and trained

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

EMT Intervention | AEMT Intervention | PARAMEDIC Intervention | Online Medical Control

Northeast Ohio Regional EMS Protocol - 8|2

</tr>
</tbody>
</table>

**KEY POINTS**

- With complete obstruction, positive-pressure ventilation may be successful.
- Needle cricothyrotomy will provide short term oxygenation only (not ventilation) and is used to “buy time” until other interventions can assure appropriate ventilation.
- Cricothyrotomy kits have a larger internal diameter than needle cric and thus will provide some minimal ventilation.
- Needle cricothyrotomy and cricothyrotomy kits are bridge devices to surgical intervention.
RAPID SEQUENCE INTUBATION (RSI)

**Indications**
- SpO₂ < 90% on high flow O₂
- Respiratory rate <10 or >32
- Partial airway obstruction due to blood, secretions, trauma, or GCS less than 8
- Respiratory exhaustion or inevitable loss of the airway

**Current Approval / Special Training Required**
- Must Have at Least 3 Personnel
  - 2 Being Paramedics
- Video Laryngoscopy Must Be Available
- Have Back-Up Airways Available
- Paralytics Do Not Change Poor Anatomy

**UNIVERSAL PATIENT CARE PROTOCOL**

**BASIC MANEUVERS FIRST**
- Open airway
- Nasal / Oral Airway
- Bag-Valve-Mask

**IV / IO PROCEDURE**
- Apply nasal cannula 15 LPM during intubation attempts

**ATTEMPT INTUBATION**

**CAPNOGRAPHY PROCEDURE** Required

**Not Successful**
- Meets Above Criteria

**ETOMIDATE (AMIDATE)**
- 0.2 – 0.3 mg / kg IV / IO – Average Dose 20 mg
- OR
**KETAMINE 1 - 2 mg / kg IV / IO – Average Dose 100 mg**
- Then
**SUCCINYLCHOLINE (ANECTINE)**
- 1 - 2 mg / kg IV / IO – Average Dose 100 mg

- Burn or Crush Injury > 24hr old
- HX: Muscular Dystrophy, Multiple Sclerosis, Amyotrophic Lateral Sclerosis (ALS)
- HX: Malignant Hyperthermia (including family)
- Etomidate First
- Hyperkalemia or Renal Failure

**INTUBATION PROCEDURE**
- Max 2 Intubation Attempts
- Document Failed Attempt(s)

**Extralum (BIAD) Airway Device If Intubation Unsuccessful**

**Post Intubation Sedation**
- MIDAZOLAM (VERSED) 2.5 mg IV to tolerance - Max 10 mg
- or
**LORazepam (ATIVAN) 1 – 2 mg IV / IO to tolerance - Max 8 mg**
- Head Trauma
- If Evidence of Pain
  - fentaNYL (SUBLIMAZE) 25 mcg doses until pain tolerance
  - Max 200 mcg

**Ventilate to maintain CAPNOGRAPHY and PULSE OXIMETRY**

**TRANSPORT** to appropriate facility
**CONTACT** receiving facility
**CONSULT** Medical Direction where indicated
**APPROPRIATE** transfer of care

- EMT Intervention
- AEMT Intervention
- PARAMEDIC Intervention
- Online Medical Control

Northeast Ohio Regional EMS Protocol - 10 | 2

**INDICATIONS**
- SpO₂ < 90% on high flow O₂
- Respiratory rate <10 or >32
- Partial airway obstruction due to blood, secretions, trauma, or GCS 8 or less
- Respiratory exhaustion or inevitable loss of the airway

**SIGNS AND SYMPTOMS**
- Gagging
- Audible stridor
- Change in skin color
- Decreased LOC
- Decreased respiratory rate
- Increased or decreased respiratory rate
- Labored breathing

**DIFFERENTIAL DIAGNOSIS**
- Cardiac arrest
- Respiratory arrest
- Respiratory failure
- Anaphylaxis
- Esophageal obstruction

**Restrictions and Conditions for Procedure**
- You must be approved and trained by Medical Direction in Rapid Sequence Intubation
- Video laryngoscopy must be available
- Salvage airways (extraglottic airways) must be available
- Capnography must be available
- A minimum of 3 EMS personnel are available to facilitate the procedure, 2 of which are Paramedics

**The 7 “P’s” of Rapid Sequence Intubation**
- P = Preparation
- P = Preoxygenation
- P = Pretreatment
- P = Paralysis with Induction
- P = Protection
- P = Placement of the Tube
- P = Post-Induction Management

**KEY POINTS**
- Waveform Capnography is required before, during, and after intubation attempts. Ventilate to maintain Capnography and SpO₂.
- Succinylcholine (Anectine) is contraindicated in persons with personal or family history of malignant hyperthermia, skeletal muscle myopathies, known or suspected hyperkalemia, and hypersensitivity to the medication.
- If patient becomes hyperthermic post administration of Succinylcholine (Anectine) advise receiving facility immediately stressing it was post Succinylcholine (Anectine) administration. Begin cooling measures per the HYPERTHERMIA PROTOCOL / HEAT EXPOSURE and the INDUCED HYPOTHERMIA PROCEDURE.
- Succinylcholine (Anectine) is never given alone. It is always preceded by an induction agent (a hypnotic / sedative medication) such as Etomidate (Amidate) or Ketamine (Ketalar).
- Once Etomidate (Amidate) and Succinylcholine (Anectine) is administered the airway must be managed from that point forward.
- Larger doses of Succinylcholine (Anectine) may be required in myasthenia gravis.
- Attempt intubation prior to induction and paralysis. If unsuccessful, sedate then paralyze patient and attempt intubation. Limit attempts post paralysis to 2 attempts then utilize an extraglottic airway such as a King or an LMA.
- Apply a nasal cannula to supply 15 LPM during the intubation attempts to maintain oxygen saturation
- Consider Mallampati grade to determine difficulty PRIOR to intubation attempt
- Set up and test all equipment prior to intubation attempt, including suction and back-up airways
- Refer to ADULT AIRWAY protocol if post RSI sedation is required.
ADULT PROTOCOL

RESPIRATORY DISTRESS / ASTHMA / COPD

UNIVERSAL PATIENT CARE PROTOCOL

OXYGEN

12 LEAD EKG PROCEDURE

1ST Contact to EKG and Transmission < 10 Min

IV / IO PROCEDURE

Airway / Breathing

Mild – Symptoms

Treat with aerosol DUONEB (ALBUTEROL / IPRATROPIUM)
Oxygen as needed

EMT use only with ONLINE Medical Control

Moderate / Severe Distress

CAPNOGRAPHY PROCEDURE

Tachypnea, wheezing accessory muscle use, difficulty speaking
Treat with aerosol DUONEB (ALBUTEROL / IPRATROPIUM)

EMT use only with ONLINE Medical Control

Only if Evidence of Poor Air Exchange after DUONEB SEVERE ASTHMA / COPD
EPINEPHrine 1 mg / ml (1:1000)
0.3 – 0.5 mg IM

CPAP PROCEDURE

Only if HYPOXEMIC / not responding to basic oxygenation

Hypotension

Untreated Vomiting

Oxygen as needed
Continuous pulse-ox
Repeat aerosols as needed DUONEB (ALBUTEROL / IPRATROPIUM)

methylPREDNISolone (SOLU – MEDROL)
125 mg IV / IO

If Failed EPINEPHrine
Consider MAGNESIUM SULFATE
2 Grams IV over 20 – 60 minutes

Severe Distress with STRIDOR

CAPNOGRAPHY PROCEDURE

Tachypnea, bradypnea, stridor, accessory muscle use, difficulty speaking, CO₂ narcosis
Treat with aerosol RACEMIC EPINEPHrine
Unit Dose (2.25% 0.5ml) mixed in 3ml of Normal Saline Nebulized x1 Dose

NOT for Foreign Body Airway Obstructions
If Racemic Epinephrine is unavailable, see medication section for aerosol EPINEPHrine 1mg / ml (1:1000)

BE PREPARED for Emergency Airway
CRICOTHYROTOMY NEEDLE, KIT, or SURGICAL
As provided and trained

If Patient Occludes Airway

Must Have Med Command Training / Approval

methylPREDNISolone (SOLU – MEDROL)
125 mg IV / IO

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

EMT Intervention
AEMT Intervention
PARAMEDIC Intervention
Online Medical Medical Control
RESPIRATORY DISTRESS / ASTHMA / COPD

### HISTORY
- Asthma; COPD -- chronic bronchitis, emphysema, congestive heart failure
- Home treatment (oxygen, nebulizer)
- Medications (Theophylline, steroids, inhalers)
- Toxic exposure, smoke inhalation

### SIGNS AND SYMPTOMS
- Shortness of breath
- Pursed lip breathing
- Decreased ability to speak
- Increased respiratory rate and effort
- Wheezing, rhonchi
- Use of accessory muscles
- Fever, cough
- Tachycardia
- Tripod position

### DIFFERENTIAL DIAGNOSIS
- Asthma
- Anaphylaxis
- Aspiration
- COPD (emphysema, bronchitis)
- Pleural effusion
- Pneumonia
- Pulmonary embolus
- Pneumothorax
- Cardiac (MI or CHF)
- Pericardial tamponade
- Hyperventilation
- Inhaled toxin (Carbon monoxide, etc.)

CPAP should be used as a last resort in asthmatic / COPD patents whom are HYPOXEMIC. Prepare to intubate and ventilate.

SEVERE ASTHMA / STATUS ASTHMATICUS patients not moving air or is not moving the mist from an aerosol treatment give EPINEPHrine (Adrenaline) 1 mg / ml (1:1000) 0.3 - 0.5 mg IM.

### KEY POINTS
- Exam: Mental Status, HEENT, Skin, Neck, Heart, Lungs, Abdomen, Extremities, Neuro
- **Status asthmaticus** - severe prolonged asthma attack unresponsive to therapy - life threatening!
- If the patient is over 50 years of age, has a history of cardiac disease, or if the patient’s heart rate is >120 EPINEPHrine (Adrenaline) may precipitate cardiac ischemia.
- Monitor pulse oximetry continuously during treatment and transport.
- A silent chest in respiratory distress is a pre - respiratory arrest sign.
- Be alert for respiratory depression in COPD patients on prolonged high flow oxygen administration.
- DO NOT withhold oxygen from hypoxic patients.
- If Albuterol (Proventil) and / or Ipratropium (Atrovent) is given, monitor the patient’s cardiac rhythm and initiate IV.
- Patient with known COPD, asthma and a history of steroid use should receive IV MethylPREDNISolone (Solu-Medrol). Use with caution in diabetics (hyperglycemia), GI bleeds, and febrile patients (sepsis / infections).
- Assure enough expiration time when ventilating COPD or asthma patients to prevent breath stacking and CO2 elimination.
- Albuterol (Proventil) and Ipratropium (Atrovent) can be given down an ETT or Tracheotomy during ventilation if there is evidence of bronchoconstriction.
A D U L T  P R O T O C O L
TRAMATIC BREATHING

UNIVERSAL PATIENT CARE PROTOCOL
Evidence of Trauma – Blunt or Penetrating
Abnormal or absent breath sounds, inadequate respiratory rate, unequal symmetry, diminished chest excursion, cyanosis

Identify Treatable Causes

Assess for Patency – Consider Jaw Thrust Airway Maneuver
Give High Flow Oxygen

Sucking Chest Wound
Apply 3-sided Occlusive Dressing or Commercial Chest Seal

Flail Chest
Assist with Ventilation – Gentle Positive Pressure
Consider CPAP if isolated chest trauma and no hypotension / shock / tension pneumothorax and spontaneous adequate respiration

Penetrating Object
Immobilize Object
Apply Sterile Saline Dressing

If S&S of Tension Pneumothorax
(No lung sounds on affected side, Hypotension, JVD)
NEEDLE CHEST DECOMPRESSION PROCEDURE

WARNING: Be Prepared to Repeat IF S&S Return

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

KEY POINTS
- These injuries involve the airway and are life-threatening.
- Do not become distracted by non-life-threatening injuries that appear terrible.
- A sucking chest wound is when the thorax is open to the outside. The occlusive dressing may be anything such as petroleum gauze, plastic, or a defibrillator pad. Tape only 3 sides down so that excess intrathoracic pressure can escape, preventing a tension pneumothorax. It may help respirations to place patient on the injured side, allowing unaffected lung to expand easier.
- A flail chest is when there are extensive rib fractures present, causing a loose segment of the chest wall resulting in paradoxical and ineffective air movement. Positive pressure breathing via BVM will help push the segment and the normal chest wall out with inhalation and to move inward together with exhalation, getting them working together again. Do not use too much pressure, as to prevent additional damage or pneumothorax.
- A penetrating object must be immobilized by any means possible. If it is very large, cutting may be possible, with care taken to not move it while making the cut. Place an occlusive & bulky dressing over the entry wound.
- A tension pneumothorax is life threatening, look for HYPOTENSION, unequal breath sounds, JVD, increasing respiratory distress, and decreasing mental status. The pleura must be decompressed with a needle to provide relief. Use the intercostal space between the 2nd and 3rd ribs on the midclavicular line, going in on the top side of the 3rd rib. Alternate site, 5th intercostal space mid axillary or anterior axillary line. Once the catheter is placed, watch closely for reocclusion. Be prepared to repeat decompression if signs of tension pneumothorax return. Use a long 3 - 3 ¼” 14-gauge needle based on the patient.
SECTION 3 - CIRCULATION / SHOCK PROTOCOLS

Shock Guidelines ........................................................................................................................................2-3
Anaphylactic Shock / Reaction .............................................................................................................4-3
Cardiogenic Shock ...............................................................................................................................5-3
Hypovolemic Shock ..............................................................................................................................5-3

Septic Shock ........................................................................................................................................5-3
### SHOCK GUIDELINES

<table>
<thead>
<tr>
<th>TYPES OF SHOCK</th>
<th>SIGNS AND SYMPTOMS</th>
</tr>
</thead>
</table>
| **CARDIOGENIC SHOCK** | • Hypotension  
• Difficulty breathing  
• Cool, clammy skin  
• Weakness |
| **HYPOVOLEMIC SHOCK** | • Tachycardia  
• Weak, thready pulse  
• Hypotension with narrow pulse pressure  
• Hypotension or falling systolic BP  
• Pale skin  
• Clammy or dry skin  
• Dyspnea  
• Altered LOC / coma  
• Decreased urine output  
• Restlessness  
• Irritability  
• Decreased urine output |
| **ANAPHYLACTIC SHOCK** (Distributive Shock) | • Hypotension  
• Severe respiratory distress  
• Shock  
• Dyspnea  
• Wheezing  
• Hoarseness / stridor  
• Cyanosis  
• Facial / airway edema  
• Urticaria / hives  
• Warm burning feeling  
• Itching  
• Rhinorrhea  
• Altered LOC / coma  
• Pulmonary edema |
| **NEUROGENIC SHOCK** (Distributive Shock) | • Hypotension with a narrow pulse pressure  
• Evidence of trauma (lacerations, bruising, swelling, deformity)  
• Normal or bradycardic HR  
• Compromise in neurological function  
• Normal or flushed skin color |
| **SEPTIC SHOCK** (Distributive Shock) | • Hypotension with a narrow pulse pressure  
• Dyspnea  
• Febrile  
• Tachycardia  
• Signs of infection  
• Hx of UTI  
• Hypovolemia (Fever, Sweating)  
• Dehydration  
• Altered LOC / coma |
| **OBSTRUCTIVE SHOCK** | • Obstruction that interferes with preload / afterload  
• Commonly caused by tension pneumothorax / pulmonary embolism  
• Hypotension  
• Chest pain  
• Hypoxia  
• Absent lung sounds (tension pneumothorax)  
• Present lung sounds (pulmonary embolism) |
**SIGNS**

- Anaphylactic
- Addisonian
- Septic

**DIFFERENTIAL DIAGNOSIS**

- Shock
- Hypovolemic
- Cardiogenic
- Septic
- Neurogenic
- Anaphylactic
- Ectopic pregnancy
- Dysrhythmias
- Pulmonary embolus
- Tension pneumothorax
- Medication effect / overdose
- Vasovagal hypotension
- Physiologic (pregnancy)

### HISTORY

- Blood loss - vaginal or gastrointestinal bleeding, AAA, ectopic
- Fluid loss - vomiting, diarrhea, fever
- Infection
- Cardiac ischemia (MI, CHF)
- Medications
- Allergic reaction
- Pregnancy

### SIGNS AND SYMPTOMS

- Restlessness, confusion
- Weakness, dizziness
- Weak, rapid pulse
- Pale, cool, clammy skin
- Delayed capillary refill
- Hypotension
- Coffee-ground emesis
- Tarry stools

### KEY POINTS

- Exam: Mental Status, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro
- Hypotension can be defined as a systolic blood pressure of less than 90 systolic or MAP less than 65.
- Consider performing orthostatic vital signs on patients in non-trauma situations if suspected blood or fluid loss.
- Consider all possible causes of shock and treat per appropriate protocol.

**Anaphylactic Shock**

- Anaphylactic shock is the involvement of 2 or more body systems. Consider IM EPINEPHrine (Adrenaline).
- Do not confuse EPINEPHrine (Adrenaline) 1 mg / ml (1:1000) IM and 0.1 mg / ml (1:10,000) IV.
- Treat patients with a history of anaphylaxis aggressively.
- Routine assessment and supportive care of the patient’s respiratory and cardiovascular systems is required.
- When possible, remove any stingers.

**Cardiogenic Shock**

- Circulatory failure is due to inadequate cardiac function.
- Be aware of patients with congenital defects.
- Cardiogenic shock exists in the prehospital setting when an MI is suspected and there is no specific indication of volume related shock.
- Pulmonary edema or CHF may cause cardiogenic shock. (Pediatrics with congenital heart defects may rarely have pulmonary edema)
- Marked, symptomatic tachycardia and bradycardia will also cause cardiogenic shock. Fix rate first.

**Hypovolemic Shock**

- Patients suffering from hemorrhagic shock secondary to trauma, should be treated under the Trauma Criteria, and should be rapidly transported to the nearest appropriate facility.
- Initiate a second large bore IV for all patients in hypovolemic shock, resuscitate to a MAP of at least 65 or a SBP of 90 (100 SBP if >70 years old) or radial pulses where NIBP is unavailable.

**Septic Shock**

- Hypotensive septic shock patients require aggressive fluid resuscitation and should receive vasopressor support if not responding to fluid challenges.
- Be alert for septic shock in the elderly.

**Addisonian Crisis / Adrenal Crisis**

- Not a field diagnosis. Patient / family / historian should be aware of diagnosis. They are coached to make sure the patient gets IV steroids emergently. May have their own prescribed injectable steroids for EMS to administer. Check for medical alert tags / bracelet.
- Presents with Dehydration and/or severe vomiting and diarrhea stabbing pain in the abdomen, low back, or legs, low blood pressure (shock), low blood sugar, loss of consciousness.
- Emergent steroid administration in addition to other standard resuscitation techniques. (ex. BGL correction and fluid resuscitation). Use patient supplied steroids before EMS supplied if available.
**Adult Protocol: Anaphylactic Reaction / Shock**

### Universal Patient Care Protocol
- **Oxygen**
- **Capnography Procedure**
- **IV / IO Procedure**
  - Apply Cardiac Monitor and Assess Vitals
  - Consider ITD Procedure

### Do Not Confuse

</tbody>
</table>

### Impending Arrest
- Anaphylactic Shock
  - No Radial Pulses
  - Severe Hypotension
  - Ages involved:
    - Decreased LOC
    - Airway compromise

### Secure Airway andVentilate
- EPINEPHrine 0.1 mg / ml (100 mcg / ml)
  - Concentration
  - IV / IO
  - 100 mcg (1 ml) / minute
  - Until resolution of BP
  - 500 mcg (5 ml) Max

If only AEMT Available or NO / delayed vascular access:
- EPINEPHrine (ADRENALINE)
  - 1 mg / ml (1:1000) Concentration
  - 0.3 – 0.5 mg IM

### If only EMT Available
- EPINEPHrine Auto-Injector
- EPINEPHrine Slow IV
  - 0.1 mg / ml (1:10,000)
  - IV ONLY
- IV Normal Saline Bolus
  - 20 ml / kg
  - To Maintain MAP > 65
  - or SBP 90 / Radial Pulses if NIBP Unavailable

### Aerosol - Monitor Airway
- DUONEB (ALBUTEROL / IPRATROPNIUM)
  - EMT use only with ONLINE Medical Control

### Consider Repeat
- EPINEPHrine (ADRENALINE) after 5 min. if no improvement

- methylPREDISolone
  - (SOLU - medrol)
  - 125 mg IV / IO

### Transport
- to appropriate facility
- CONTACT receiving facility
- CONSULT Medical Direction where indicated
- APPROPRIATE transfer of care

---

Do Not Administer TICAGRELOR (BRILINTA) if already on antiplatelet or blood thinner medications

Clopidogrel (Plavix), Prasugrel (Effient), Ticagrelor (Brilinta), Ticlopidine (Ticlid), Apixaban (Eliquis), Dabigatran (Pradaxa), Edoxaban (Savaysa), Fondaparinux (Arixtra), Rivaroxaban (Xarelto), Warfarin (Coumadin, Jantoven), Betrixaban (Bevyxxa)

KEY POINTS

- Make the scene safe: All chest pain patients must have an IV and 12 Lead EKG.
- Exam: Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro.
- If patient has taken Nitroglycerin (Nitro-stat) without relief, consider potency of the medication.
- If positive ECG changes, establish a second IV while enroute to the hospital.
- Monitor for hypotension after administration of Nitroglycerin (Nitro-stat) or FentaNYL (Sublimaze).
- Nitroglycerin (Nitro-stat) or FentaNYL (Sublimaze) may be repeated per dosing guidelines in the MEDICATIONS SECTION.
- Diabetics / geriatric patients often have atypical pain, vague, or only generalized complaints. Be suspicious of a “silent MI”.
- Refer to the BRADYCARDIA PROTOCOL (HR < 60 bpm) or NARROW COMPLEX TACHYCARDIA PROTOCOL (HR > 150 bpm) if indicated.
- If the patient becomes hypotensive from Nitroglycerin (Nitro-stat), FentaNYL (Sublimaze) administration, place the patient in the Trendelenburg position and administer a Normal Saline bolus.
- Be prepared to administer Narcan (Naloxone) if the patient experiences respiratory depression due to FentaNYL (Sublimaze) administration.
- If pulmonary edema is present, refer to the CHF / ACUTE PULMONARY EDEMA PROTOCOL. Consider other causes of chest pain such as aortic aneurysms, pericarditis, esophageal reflux, pneumonia, pneumothorax, costochondritis, pleurisy, pancreatitis, appendicitis, cholecystitis (gallbladder), and pulmonary embolism.
- Aspirin can be administered to a patient on Coumadin (Warfarin) unless the patient’s physician has advised them otherwise.
- If the patient took a dose of Aspirin that was less than 324 mg in the last (24) hours, then additional Aspirin can be administered to achieve a therapeutic dose of 324 mg.
- DO NOT administer Nitroglycerin (Nitro-stat) to a patient who took an erectile dysfunction medication; Sildenafil (Viagra), Tadalafil (Cialis), Vardenafil (Levitra), etc. within the last 48 hours due to potential severe hypotension.
- Nitroglycerin (Nitro-stat) can be administered to a patient by EMS if the patient has already taken their own prior to your arrival. Document it if the patient had any changes in their symptoms or a headache after taking their own Nitroglycerin. Nitroglycerin (Nitro-stat) can be administered to a hypertensive patient complaining of chest discomfort without Medical Direction permission.
- Nitroglycerin (Nitro-stat) can be administered without an IV if patient has a BP greater than 120 mmHg, without signs of inferior wall MI.
- DO NOT treat PVC’s with Amiodarone (Cordarone) unless patient develops runs of V-Tach or has sustained V-tach.
- Pulse oximetry is not an indicator of myocardial perfusion.
- Only administer oxygen if the patient is hypoxic with a SpO₂ of less than 94. Do not withhold oxygen from patients that are short of breath regardless of SpO₂.
- Once applied to a known or suspected ACS patient do not remove a 12 lead EKG, even if the initial EKG is unremarkable. Some devices continue to look for ST segment changes and will alert if there are changes.

| I – Lateral | aVR | V1 – Septal | V4 – Anterior |
| I – Inferior | aVL – Lateral | V2 – Septal | V5 – Lateral |
| III – Inferior | aVF – Inferior | V3 – Anterior | V6 – Lateral |

• Sinus bradycardia  
• Athletes  
• Head injury (elevated ICP) or stroke  
• Spinal cord lesion  
• Sick sinus syndrome  
• AV blocks (1°, 2°, or 3°) |

### KEY POINTS

- Exam: Mental Status, Neck, Heart, Lungs, Neuro
- The use of Amiodarone (Cordarone) in heart block can worsen bradycardia and lead to asystole.
- Treatment of bradycardia is based upon the presence or absence of hypotension.
- If hypotension exists, treat. If blood pressure is adequate, monitor only but have all treatment modalities immediately available if the patient decompensates.
- Transcutaneous pacing is the treatment of choice for Type II second-degree heart blocks and third-degree heart blocks.
- Transcutaneous pacing in demand mode will shut off if patient’s intrinsic heart rate rises above the set pacer rate.
- If the patient is critical and an IV is not established, initiate pacing use intranasal sedation if required.
- If the patient converts to another rhythm, refer to the appropriate protocol and treat accordingly.
- If bradycardia is a result of calcium channel blocker or beta blocker overdose, follow the Toxic Ingestion / Exposure / Overdose protocol.
Northeast Ohio Regional EMS Protocol

**NARROW – COMPLEX TACHYCARDIA**

**UNIVERSAL PATIENT CARE PROTOCOL**

- APPLY CARDIAC MONITOR
- OXYGEN
- CAPNOGRAPHY PROCEDURE
- IV / IO PROCEDURE

**Identify Rhythm type Regular or Irregular**

**Stable / Regular / (SVT)**

- 12 LEAD EKG PROCEDURE
- Attempt Vagal Maneuvers (NO carotid massage)

- ADENOSINE (ADENOCARD)
  6 mg IV push followed by 20 ml Normal Saline push
  (Not for rapid Atrial Fibrillation or WPW)

  **IF No Response**
  1 – 2 minutes

- ADENOSINE (ADENOCARD)
  12 mg IV push followed by 20 ml Normal Saline

- **Supportive Care, Treatment of Symptoms and Close Observation are all that is generally required**

**Stable / Irregular (A-Fib)**

- 12 LEAD EKG PROCEDURE

- **NORMAL SALINE**
  Consider Fluid Bolus to Rule out Hypovolemia / Dehydration as Cause of Tachycardia

- **Consider Sedation**
  MIDAZOLAM (VERSED) 2.5 mg IV / IO or 5 mg IM / IN
  OR
  LORazepam (ATIVAN) 1 – 2 mg IV / IO / IM / IN

  **If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for DiazePAM (Valium)**

- **Capnography Required**

**Unstable / Regular or Irregular**

- SBP < 90, No Radial Pulses, AMS, Chest Pain, Shock

- Use **EXTREME Caution When Cardioverting IRREGULAR Tachycardias.**

- **SIGNIFICANT Potential to Cause CVA, Specifically if Greater Than 48 Hours Duration**

- **Consider Sedation**
  MIDAZOLAM (VERSED) 2.5 mg IV / IO or 5 mg IM / IN
  OR
  LORazepam (ATIVAN) 1 – 2 mg IV / IO / IM / IN

  **If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for DiazePAM (Valium)**

- **Capnography Required**

- **Synchronized CARDIOVERSION**
  50 – 100 J or Device Recommendation

  **Irregular Rhythms / Afib**

**No Response 1 –2 minutes**

- Repeat Synchronized CARDIOVERSION
  200, 300, 360 J or Device Recommendation

  **Irregular Rhythms / AFib**

**TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care**
### HISTORY
- Medications (Aminophylline, diet pills, thyroid supplements, decongestants, digoxin)
- Diet (caffeine, chocolate)
- Drugs (nicotine, cocaine)
- Past medical history
- History of palpitations / heart racing
- Syncope / near syncope

### SIGNS AND SYMPTOMS
- HR > 150 bpm
- QRS < .12 Sec
- Dizziness, CP, SOB
- Potential presenting rhythm
- Sinus tachycardia
- Atrial fibrillation / flutter
- Multifocal atrial tachycardia

### DIFFERENTIAL DIAGNOSIS
- Heart disease (WPW, valvular)
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion, pain, emotional stress
- Fever
- Hypoxia
- Hypovolemia or anemia
- Drug effect / overdose (see HX)
- Hyperthyroidism
- Pulmonary embolus

### KEY POINTS
- Exam: Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Continuous pulse oximetry is required for all tachycardic patients.
- Document all rhythm changes with monitor strips and obtain monitor strips with each intervention.
- If the patient converts to another rhythm, refer to the appropriate protocol and treat accordingly.
- Examples of vagal maneuvers include bearing down, coughing, or blowing into a syringe. DO NOT perform a carotid massage.
- If possible, the IV should be initiated in either AC.
- Consider applying the cardioversion / pacing pads prior to Adenosine (Adenocard) administration.
- When administering Adenosine (Adenocard), raise the patient’s arm and immediately follow the bolus with 20 ml rapid bolus of normal saline.
- Record 3-Lead EKG strips during Adenosine (Adenocard) administration.
- Perform a 12-Lead EKG prior to and after Adenosine (Adenocard) conversion or after cardioversion.
- If the patient converts to ventricular fibrillation or pulseless ventricular tachycardia immediately DEFIBRILLATE, the patient and refer to the appropriate protocol and treat accordingly. Be sure to switch the defibrillator out of “Sync” before defibrillating.
- Give a copy of the EKGs and / or code summaries with the receiving facility upon arrival.
- Transient periods of sinus bradyarrhythmia and ventricular ectopy are common after termination of SVT.
- It is unlikely that symptoms of instability are caused primarily by the tachycardia when the HR is <150 unless there is impaired ventricular function.
**ADULT PROTOCOL**

**WIDE – COMPLEX TACHYCARDIA – With Pulse**

**UNIVERSAL PATIENT CARE PROTOCOL**
- APPLY CARDIAC MONITOR
- OXYGEN
- CAPNOGRAPHY PROCEDURE
- IV / IO PROCEDURE

**Identify Rhythm type Regular or Irregular**

**Stable / Regular**
- 12 LEAD EKG PROCEDURE
- Attempt Vagal Maneuvers (NO carotid massage)

**Unstable / Regular or Irregular**
- SBP < 90, No Radial Pulses, AMS, Chest Pain, Shock
- Consider Sedation
  - MIDAZOLAM (VERSED) 2.5 mg IV / IO or 5 mg IM / IN
  - OR
  - LORazepam (ATIVAN) 1 – 2 mg IV / IO / IM / IN

**Stable / Irregular**
- 12 LEAD EKG PROCEDURE
- Attempt Vagal Maneuvers (NO carotid massage)

**AMIODARONE (CORDARONE)**
- 150 mg IV / IO mix in 100 ml DSW
- Over 10 minutes

**MONOMORPHIC WIDE COMPLEX TACHYCARDIA**
- Consider
  - ADENOSINE (ADENOCARD)
  - 6 mg IV push
  - followed by 20 ml
  - Normal Saline push
  - May consider
  - ADENOSINE (ADENOCARD)
  - 12 mg IV push if required

**AMIODARONE (CORDARONE)**
- 150 mg IV / IO mix in 100 ml DSW
- Over 10 minutes

**If Torsades de pointes**
- MAGNESEUM SULFATE
  - 1 – 2 grams IV / IO
  - over 5 to 60 minutes

**Synchronized CARDIOVERSION**
- 100 J
- or Device Recommendation

**No Response 1 – 2 minutes**
- Repeat Synchronized CARDIOVERSION
- 200, 300, 360 J or Device Recommendation

**Irregular Rhythms / Afib**
- Defibrillate if Torsades, do not Synchronize Cardiovert

**Consider Medications if Cardioversion Unsuccessful**
- AMIODARONE (CORDARONE)
  - 150 mg IV / IO
  - mix in 100 ml DSW
  - Over 10 minutes

**If Amiodarone (Cordarone) Unavailable, See Medication Section for Lidocaine (Xylocaine)**
- Must have USEABLE 12 Lead EKG and Have Transmitted to Hospital
- **IF PREGNANT** – USE LIDOCAINE, see Medication Section

**If Amiodarone (Cordarone) Unavailable, See Medication Section for Lidocaine (Xylocaine)**
- Must have USEABLE 12 Lead EKG and Have Transmitted to Hospital
- **IF PREGNANT** – USE LIDOCAINE, see Medication Section

**If Torsades de pointes**
- MAGNESEUM SULFATE
  - 1 – 2 grams IV / IO
  - over 5 minutes

**TRANSPORT** to appropriate facility
**CONTACT** receiving facility 
**CONSULT** Medical Direction where indicated **APPROPRIATE** transfer of care

**EMT Intervention** 
**AEMT Intervention** 
**PARAMEDIC Intervention** 
**Online Medical Control**
## HISTORY
- Past medical history / medications, diet, drugs.
- Syncope / near syncope
- Palpitations
- Pacemaker
- Allergies: Amiodarone (Cordarone)

## SIGNS AND SYMPTOMS
- Ventricular tachycardia on ECG (runs or sustained)
- Conscious, rapid pulse
- Chest pain, shortness of breath
- Dizziness
- Rate usually 150+ bpm for sustained V-Tach

## DIFFERENTIAL DIAGNOSIS
- Artifact / device failure
- Cardiac
- Endocrine / metabolic
- Drugs
- Pulmonary

### KEY POINTS
- Exam: Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Polymorphic V-Tach (Torsades de Pointes) may benefit from the administration of Magnesium Sulfate.
- Polymorphic V-Tach (Torsades de Pointes) requires defibrillation rather than synchronized cardioversion.
- If the patient converts to another rhythm, refer to the appropriate protocol and treat accordingly.
- If the patient relapses back into wide complex tachycardia / ventricular tachycardia, initiate synchronized cardioversion with the joules setting that previously cardioverted the patient.
- Record 3 / 4 - Lead EKG strips during medication administration.
- Perform a 12- Lead EKG prior to and after medication administration, or synchronized cardioversion of wide complex tachycardia / ventricular tachycardia.
- Perform a code summary and attach it to the patient run report.
- Be sure to treat the patient and not the monitor.
CARDIAC ARREST

AT ANY TIME
Return of Spontaneous Circulation (ROSC)
GO TO POST RESUSCITATION CARDIAC CARE

BEGIN CPR IMMEDIATELY

ATTACH CARDIAC MONITOR
Defibrillator / AED as soon as available

DELIVER SHOCK x 1 if Shockable
Immediately Resume CPR - 2 minutes

IV / IO PROCEDURE
AIRWAY PROTOCOL

DELIVER SHOCK x 1 if Shockable
Maintain CPR / Airway
Follow AED Prompts (if applicable)

CONTINUE CPR

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care

REVIEW DNR COMFORT CARE
Criteria for Death
Criteria for DNR

AT ANY TIME
Go to Appropriate Protocol
Identify known dialysis patients in asystole, V-Fib or pulseless V-Tach

IF ALS CARE AVAILABLE IN FIELD
Patients in cardiac arrest SHOULD be worked on scene UNLESS special resuscitation circumstances exist that would benefit from hospital treatment unavailable in the field

Field Termination
BLS
1. Arrest not witnessed by EMS / first responders
2. No ROSC has been obtained after 20 min of CPR
3. Non-shockable rhythm

Field Termination
ALS
1. Arrest not witnessed by EMS / first responders
2. Advanced Airway in Place
3. Vascular Access in Place
4. Continuous CPR During Resuscitation
5. At Least 2 Rounds of ACLS Medications
6. Asystole Confirmed in 2 leads
7. 20 Minutes of Resuscitation
8. An intra-arrest capnography reading <10 indicates no perfusion and may be helpful in considering termination or efforts.

EMT Intervention
AEMT Intervention
PARAMEDIC Intervention
Online Medical Control
# Adult Protocol

## Cardiac Arrest

### History
- Events leading to arrest
- Estimated downtime
- Past medical history
- Medications
- Existence of terminal illness
- Signs of lividity, rigor mortis
- DNR

### Signs and Symptoms
- Unresponsive
- Apneic
- Pulseless

### Differential Diagnosis
- Medical vs. trauma
- V-fib vs. pulseless V-tach
- Asystole
- Pulseless electrical activity (PEA)

### Key Points
- Exam: Mental Status
- Always minimize interruptions to chest compressions.
- Success is based on proper planning and execution. Procedures require space and patient access, make room to work.
- Reassess airway frequently and with every patient move.
- Maternal arrest - Treat mother per appropriate protocol with immediate notification to Online Medical Control and rapid transport.
- When IV access failed or difficult, humeral head IO are preferred routes over tibial IO for resuscitation.
- If the patient converts to another rhythm, refer to the appropriate protocol and treat accordingly.
- Attempt to obtain patient history from family members or bystanders.
  - Estimated down time
  - Medical history
  - Complaints prior to arrest
  - Bystander CPR prior to EMS arrival
  - AED use prior to EMS arrival
- Administer Dextrose only if the patient has a blood glucose level < 70 mg/dl. Dextrose should be administered as soon as hypoglycemia is determined.
- Reassess the patient if the interventions do not produce any changes.
- If indicated, refer to the TERMINATION OF RESUSCITATION EFFORTS POLICY.
- If patient is pregnant and in cardiac arrest, manually manipulate the uterus to the left during CPR.
ASYSTOLE / PULSELESS ELECTRICAL ACTIVITY (PEA)

**AT ANY TIME**
Return of Spontaneous Circulation (ROSC)
GO TO POST RESUSCITATION CARDIAC CARE PROTOCOL

**Known dialysis patient consider:**
- Flush IV Line Then CALCIUM GLUCONATE 1 – 3 Grams SLOW IV / IO OR CALCIUM CHLORIDE 1 Gram SLOW IV / IO
- Flush IV Line Then SODIUM BICARBONATE 1 mEq / kg up to 200 mEq IV / IO

**Universal Patient Care Protocol**
- Criteria for Death
- Criteria for DNR

**Begin CPR Immediately**

**Airway Protocol**

**Capnography Procedure**
- Apply Cardiac Monitor / AED
- Asystole / PEA Persists
- Continue CPR

**IV / IO Procedure**
- EPINEPHrine (ADRENALINE) as soon as possible after vascular access
  - 1 mg IV / IO of 0.1 mg / ml (1:10,000)
  - Repeat every 3 - 5 minutes
- Continue CPR

**Consider Termination – See Field Termination of Resuscitative Efforts Policy**
- TRANSPORT to appropriate facility
- CONTACT receiving facility
- CONSULT Medical Direction where indicated
- APPROPRIATE transfer of care

**Field Termination**
- BLS
  - 1. Arrest not witnessed by EMS / first responders
  - 2. No ROSC has been obtained after 20 min of CPR
  - 3. Non-shockable rhythm

- ALS
  - 1. Arrest not witnessed by EMS / first responders
  - 2. Advanced Airway in Place
  - 3. Vascular Access in Place
  - 4. Continuous CPR During Resuscitation
  - 5. At Least 2 Rounds of ACLS Medications
  - 6. Asystole Confirmed in 2 leads
  - 7. 20 Minutes of Resuscitation
  - 8. An intra-arrest capnography reading <10 indicates no perfusion and may be helpful in considering termination or efforts.

**If patient awakens during CPR or CPR device use, despite a non-life sustaining rhythm that interferes with treatment give**
- KETAMINE (KETALAR) 10 mg IV / IO
- MIDAZOLAM (VERSED) 2.5 mg IV / IO
- Repeat as needed to yield patient response permitting resuscitation
ASYSTOLE / PULSELESS ELECTRICAL ACTIVITY (PEA)

**HISTORY**
- Past medical history
- Medications
- Events leading to arrest
- End stage renal disease
- Estimated downtime
- Suspected hypothermia
- Suspected overdose
- DNR
- Tricyclics
- Digitalis
- Beta blockers
- Calcium channel blockers

**SIGNS AND SYMPTOMS**
- Pulseless
- Apneic
- No electrical activity on ECG
- Cyanosis

**DIFFERENTIAL DIAGNOSIS**
- Medical vs. trauma
- Hypoxia
- Potassium (hypo / hyper)
- Acidosis
- Hypothermia
- Device (lead) error
- Death
- Hypovolemia
- Cardiac tamponade
- Drug overdose (Tricyclics, digitalis, beta blockers, calcium channel blockers
- Massive myocardial infarction
- Tension pneumothorax
- Pulmonary embolus

**CONSIDER TREATABLE CAUSES**
- Hypovolemia
- Hypo-hyperkalemia
- Hypoxia
- Hypoglycemia
- Hydrogen ion (acidosis)
- Hypothermia

- Toxins
- Tamponade (cardiac)
- Tension pneumothorax
- Thrombosis (coronary or pulmonary)
- Trauma

**KEY POINTS**
- Exam: Mental Status
- Always minimize interruptions to chest compressions.
- When IV access failed or difficult, humeral head IO are preferred routes over tibial IO for resuscitation.
- Always confirm asystole in more than one lead.
- Consider each possible cause listed in the differential: Survival is based on identifying and correcting the cause!
- Discussion with Online Medical Control can be a valuable tool in developing a differential diagnosis and identifying possible treatment options.
- If the patient converts to another rhythm, refer to the appropriate protocol and treat accordingly.
- Early identification and treatment of reversible causes of PEA increases the chance of a successful outcome.
- Consider volume infusion for all patients in PEA. Be alert for fluid overload.
- Treat as ventricular fibrillation if you cannot differentiate between asystole and fine ventricular fibrillation.
- Dextrose should only be administered to a patient with a confirmed blood glucose level less than 70 mg / dl.
- If patient is pregnant and in cardiac arrest, manually manipulate the uterus to the left during CPR.
VENTRICULAR FIBRILLATION (V – FIB)
PULSELESS VENTRICULAR TACHYCARDIA

AT ANY TIME
Return of Spontaneous Circulation (ROSC)
GO TO POST RESUSCITATION CARDIAC CARE

Known dialysis patient consider:
 Flush IV Line Then CALCIUM GLUCONATE 1 - 3 Grades SLOW IV / IO
 OR CALCIUM CHLORIDE 1 Gram Slow IV / IO

DO NOT MIX WITH SODIUM BICARBONATE IN SAME LINE

Flush IV Line Then SODIUM BICARBONATE 1 mEq / kg up to 200 mEq IV / IO

REFRACTORY V-FIB / TACH
After failed highest defibrillation settings and antiarrhythmics

CONSIDER
ELECTRICAL VECTOR CHANGE
Add Anterior / Posterior Pads
Attempt Defibrillation

Then CONSIDER DOUBLE SEQUENTIAL DEFIBRILLATION
If capable, after minimum of 4 unsuccessful EMS defibrillations

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care

IF ALS CARE AVAILABLE IN FIELD
Patients in cardiac arrest SHOULD be worked on scene UNLESS special resuscitation circumstances exist that would benefit from hospital treatment unavailable in the field

If patient awakens during CPR or CPR device use, despite a non-life sustaining rhythm that interferes with treatment give KETAMINE (KETALAR) 10 mg IV / IO or MIDAZOLAM (VERSED) 2.5 mg IV / IO
Repeat as needed to yield patient response permitting resuscitation

AMIODARONE (CORDARONE) 300 mg IV / IO
May repeat @ 150 mg IV / IO in 3 - 5 minutes

CONSIDER MAGNESIUM SULFATE 1 – 2 grams slow IV / IO (Torsades, Alcoholism, Malnutrition ONLY)

Consider Field Termination of Resuscitative Efforts
### VENTRICULAR FIBRILLATION (V – FIB)
### PULSELESS VENTRICULAR TACHYCARDIA

<td></td>
<td>• Pulmonary embolus</td>
</tr>
</tbody>
</table>

### KEY POINTS
- Exam: Mental Status
- Always minimize interruptions to chest compressions.
- When IV access failed or difficult, humeral head IO are preferred routes over tibial IO for resuscitation.
- Effective CPR should be as continuous as possible with a minimum of 5 cycles or 2 minutes.
- Reassess and document endotracheal tube placement and Capnography frequently, after every move, and at discharge.
- Polymorphic V-Tach (Torsades de Pointes) may benefit from administration of Magnesium Sulfate.
- If the patient converts to another rhythm, or has a return of circulation, refer to the appropriate protocol and treat accordingly.
- If the patient converts back to ventricular fibrillation or pulseless ventricular tachycardia after being converted to ANY other rhythm, defibrillate at the previous setting used.
- Defibrillation following effective CPR is the definitive therapy for ventricular fibrillation and pulseless ventricular tachycardia. Magnesium Sulfate should be administered early in the arrest if hypomagnesemia (chronic alcoholic or malnourished patients) is suspected.
- If patient is pregnant and in cardiac arrest, manually manipulate the uterus to the left during CPR
- Zoll and Phillips equivalency settings are 120,150,200 Joules to Physio Control / Stryker 200,300,360 Joules. If unsure about settings use highest joule setting per AHA.
- Damage to defibrillators during double sequential defibrillation may not be covered by manufacturers, use the technique with prior approval from your department
- Do not delay transport or make stops to obtain a second defibrillator to accomplish double sequential defibrillation. This is only for situations where two are already on scene. The defibrillators do not have to be of the same make / model.
- Dextrose should only be administered to a patient with a confirmed blood glucose level less than 70 mg / dl.
**POST – RESUSCITATION CARDIAC CARE**

- **Consider transport of resuscitated patient** to facility with hypothermic resuscitation protocol and PCI where available

- **Assure Secured Airway**
  - Continue Ventilatory Support with OXYGEN
  - Target Spo2 92 – 98%
  - CAPNOGRAPHY PROCEDURE Target Co2 35 - 45
  - Assure IV / IO Access Patency
  - 12 LEAD EKG PROCEDURE

- **Vital Signs**

  - **Bradycardia**
    - Treat per BRADYCARDIA PROTOCOL

  - **Hypotension**
    - IV NORMAL SALINE BOLUS To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable
    - EPINEPHrine (Adrenaline)
      - Make 10 mcg / ml
      - 10 mcg (1 ml) every 2 – 5 min slow push
      - Titrate to effect
      - To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable

  - **Electrical Conversion**
    - Supportive Care Only Anti-arrhythmic not necessary unless there is gross ventricular ectopy

  - **Anti-Arrhythmic Given**
    - No Post Arrest Anti-Arrhythmic Administered

- **If arrest reoccurs, revert to appropriate protocol and / or initial successful treatment**

  - TRANSPORT to appropriate facility
  - CONTACT receiving facility
  - CONSULT Medical Direction where indicated
  - APPROPRIATE transfer of care

---

**EMT Intervention**  **AEMT Intervention**  **PARAMEDIC Intervention**  **Online Medical Control**
RECEIVING HOSPITAL MUST BE ABLE TO CONTINUE COOLING!

Use of this protocol is dependent on the ability of the receiving hospital to continue the cooling. Do not begin cooling if the receiving hospital is unable to continue cooling.

Use this protocol in conjunction with standard post resuscitation care. Maintain BP and heart rhythm with treatments in the POST RESUSCITATION CARDIAC CARE protocol. If patient loses pulses / re-arrests discontinue cooling and treat per appropriate arrest protocol.

**COMATOSE ADULT PATIENT WITH A RETURN OF SPONTANIOUS CIRCULATION (ROSC)**

- **Advanced airway in Place?**
  - Intubated, or Extraglottic (BIAD) Airway
  - Capnography Procedure
  - Maintain CO₂ 35 - 45

- **Stop**
  - Do not cool patient who arrested from trauma, hypovolemia, preexisting hypothermia, or is pregnant.

- **Apply Cooling Collar**
  - or
- **Apply Cold Packs**
  - Neck, Bilateral Axilla, Bilateral Groin

**Is patient shivering?**

- **TRANSPORT**
  - Transport to facility with TTM resuscitation protocol

- **TRANSPORT** to appropriate facility

- **CONTACT** receiving facility

- **CONSULT** Medical Direction where indicated

- **APPROPRIATE** transfer of care

**MIDAZOLAM (VERSED)**
- 2.5 mg IV / IO or 5 mg IM / IN
- OR
- LORazepam (ATIVAN)
- 1 – 2 mg IV / IO / IM / IN

⚠️ If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for DIAZEPAM (Valium)

**Place advanced airway or treat by POST RESUSCITATION CARDIAC CARE protocol only if unable to place advanced airway**

**Do not delay transport to begin TTM protocol**
### POST – RESUSCITATION CARDIAC CARE

<table>
<thead>
<tr>
<th>HISTORY</th>
<th>SIGNS AND SYMPTOMS</th>
<th>DIFFERENTIAL DIAGNOSIS</th>
</tr>
</thead>
</table>
| • Respiratory arrest  
• Cardiac arrest | • Return of pulse | • Continue to address specific differentials associated with the original dysrhythmia |

### KEY POINTS
- **Exam:** Mental Status, Neck, Skin, Lungs, Heart, Abdomen, Extremities, Neuro
- Most patients immediately post resuscitation will require ventilatory assistance.
- The condition of post-resuscitation patients fluctuates rapidly and continuously, and they require close monitoring.
- Appropriate post-resuscitation management can best be planned in consultation with Online Medical Control.
- This is the period of time between restoration of spontaneous circulation and the transfer of care at the emergency department. The focus is aimed at optimizing oxygenation and perfusion.
- Post resuscitation SVT should initially be left alone, but routinely monitor the patient. Follow **NARROW COMPLEX TACHYCARDIA PROTOCOL** or contact Medical Direction.
- If the patient is profoundly bradycardic, refer to the **BRADYCARDIA PROTOCOL** and treat accordingly.
- Only administer oxygen if the patient is hypoxic with a $\text{SpO}_2$ of 94 or less. Do not withhold oxygen from patients that are short of breath regardless of $\text{SpO}_2$.

**KEY POINTS**

- Required Exam: Mental Status, Skin, HEENT, Neck, Heart, Lung, Abdomen, Back, Extremities, Neuro
- Abdominal pain in women of childbearing age should be treated as an ectopic pregnancy until proven otherwise.
- The diagnosis of abdominal aneurysm should be considered with abdominal pain in patients over 50.
- Appendicitis may present with vague, peri-umbilical pain, which migrates, to the RLQ over time.
- It is important to remember that abdominal pain can be caused by many different disease processes. The organ systems that may be involved in abdominal pain include esophagus, stomach, intestinal tract, liver, pancreas, spleen, kidneys, male and female genital organs, bladder, as well as referred pain from the chest that can involve the heart, lungs or pleura. Abdominal pain may also be caused by muscular and skeletal problems.
- Abdominal pain emergencies are likely to lead to death due to hypovolemia. There may also be severe electrolyte abnormalities that can cause arrhythmias.
- Myocardial infarction may present as abdominal pain especially in the diabetic and elderly.
- In some patients, cardiac chest pain may manifest as abdominal pain. Consider this in all patients with abdominal pain, especially patients with diabetes and in women.
- Because the abdominal pain may be of cardiac origin, perform cardiac monitoring and a 12-Lead EKG.
- DKA may present with abdominal pain, nausea, and vomiting. Check blood glucose level.
- Ketamine use in pregnancy is a risk / benefit assessment per case. Consult Medical Direction if there are questions.
ALTERED LEVEL OF CONSCIOUSNESS

**UNIVERSAL PATIENT CARE PROTOCOL**
Consider SPINAL MOTION RESTRICTION

**AIRWAY PROTOCOL**

**12 LEAD EKG PROCEDURE**
- 1ST Contact to EKG and Transmission < 10 Min

**OXYGEN / PULSE OXIMETRY PROCEDURE**

**CAPNOGRAPHY PROCEDURE**

**BLOOD GLUCOSE PROCEDURE**

**IV PROCEDURE**
Identify Treatable Causes
Treat Per Specific Protocol

- **Seizure** – Treat per Seizure Protocol
- **Hypoxia** – Treat per Airway / Breathing Protocols
- **Anaphylaxis / Allergic Reaction**
- **Sepsis** – Treat per Septic Shock Protocol
- **Hypotension** – Treat per Specific Shock Protocols
- **Arrhythmia** – Treat per Correct Arrhythmia Protocol
- **Psychiatric** – Treat per Behavioral Emergencies
- **Hypo / Hyperglycemia** – Treat per Diabetic Protocol
- **Hypo / Hyperthermia** – Treat per Specific Protocol
- **Stroke CVA / TIA** – Treat per Stroke Protocol
- **Overdose** – Treat per Toxic Ingestion Protocol
- **Head Trauma** – Treat per Head Trauma Protocol
## Altered Level of Consciousness

### History
- Known diabetic, medic alert tag
- Drugs, drug paraphernalia
- Report of illicit drug use or toxic ingestion
- Past medical history
- Medications
- History of trauma

### Signs and Symptoms
- Decreased mental status
- Change in baseline mental status
- Bizarre behavior
- Hypoglycemia (cool, diaphoretic skin)
- Hyperglycemia (warm, dry skin; fruity breath; Kussmaul resps; signs of dehydration)

### Differential Diagnosis
- Head trauma
- CNS (stroke, tumor, seizure, infection)
- Cardiac (MI, CHF)
- Infection
- Thyroid (hyper / hypo)
- Shock (septic, metabolic, traumatic)
- Diabetes (hyper / hypoglycemia)
- Toxicological incident
- Acidosis / alkalosis
- Environmental exposure
- Pulmonary (hypoxia)
- Electrolyte abnormality
- Psychiatric disorder

### Key Points
- Exam: Mental Status, HEENT, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro
- Be aware of AMS as potential sign of an environmental toxin or Haz-Mat exposure and protect personal safety.
- It is safer to assume hypoglycemia than hyperglycemia if doubt exists.
- Do not let alcohol confuse the clinical picture. Alcoholics frequently develop hypoglycemia and need Thiamine before glucose.
- Low glucose (< 70), normal glucose (70 - 120), high glucose (> 250).
- Consider restraints if necessary for patient's and / or personnel's protection per the restraint procedure.
- Protect the patient airway and support ABCs.
- Signs and symptoms of narcotic overdose include respiratory depression and altered mental status.
- Naloxone (Narcan) administration may cause the patient to go into acute opiate withdraw, which includes vomiting, agitation, and / or combative behavior. Always be prepared for combative behavior.
- Naloxone (Narcan) may wear off in as little as 20 minutes causing the patient to become more sedate and possibly hypoventilate. All A&O 4 patients having received Naloxone (Narcan) should be transported. If patient refuses transport, contact Online Medical Control before release.
**ADULT PROTOCOL**

**ANTI-EMETIC PROTOCOL**

**UNIVERSAL PATIENT CARE PROTOCOL**

Administer OXYGEN

**IV PROCEDURE**

Patient has Nausea or Vomiting

**12 LEAD EKG PROCEDURE**

▲ 1ST Contact to EKG and Transmission < 10 Min

**ONDANSETRON (ZOFRAN) 4 mg IV / IM**

**PROMETHAZINE (PHENERGAN)**

12.5 mg IV / 25 mg IM

**OR**

**ONDANSETRON (ZOFRAN)**

Orally Disintegrating Tablet

4 mg Oral – may repeat max 8 mg

**TRANSPORT** to appropriate facility

**CONTACT** receiving facility

**CONSULT** Medical Direction where indicated

**APPROPRIATE** transfer of care
### HISTORY
- Nausea
- Vomiting
- Medication(s) administration such as narcotic analgesics

### SIGNS AND SYMPTOMS
- Complaints of nausea and/or vomiting

### DIFFERENTIAL DIAGNOSIS
- Consider AMI / 12 lead EKG
- Gastroenteritis
- Toxic ingestion / food poisoning
- Bowel obstruction
- Appendicitis
- Gastritis
- Cholecystitis (gallbladder)
- Hepatitis / cirrhosis
- Headaches / migraine
- Pregnancy
- Hypertensive crisis
- Electrolyte imbalances
- DKA
- Intracranial pressure
- Sepsis / infections

### KEY POINTS
- Position patient to protect airway as appropriate. (Recovery position, sitting up, etc.)
- Immediately position entire patient or their head to side if patient begins vomiting then retrieve suction.
- Patients with altered LOC and nausea/vomiting need to have airway maintenance prioritized before medication.
- Prepare and test suction prior to its need.
- Give Ondansetron (Zofran) or Promethazine (Phenergan) over at least 2 minutes, slow IV. Follow up with second dose in if symptoms unresolved.
- Treat patients early, no need to wait for patient to begin vomiting to administer Ondansetron (Zofran) or Promethazine (Phenergan).
- Patients receiving medications such as narcotic analgesics may require concurrent administration of Ondansetron (Zofran) or Promethazine (Phenergan) to reduce nausea associated with such medications.
BEHAVIORAL / PSYCHIATRIC EMERGENCIES

For Use in ADULT Psychosis Only
NOT For Medical Emergencies Such as Hypoxemia, Sepsis, Seizure, Encephalitis, Hypoglycemia, or Stroke

If patient is Hyperthermic begin cooling with ice packs in groin and axilla.

Agitation – Not Combative
MIDAZOLAM (VERSED)
2.5 mg IV / IO or 5 mg IM / IN
OR
LORazepam (ATIVAN)
1 – 2 mg IV / IO / IM / IN

If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)
AEMT with MD Approval
Do not use Midazolam (Versed) or LORazepam (Ativan) and OLANZapine (ZyPrexa) together

Or may Consider
WITH PSYCHOSIS patient only
OLANZapine (ZyPREXA)
Orally Disintegrating Tablet
10 mg Oral
Instead of Midazolam (Versed)

CAPNOGRAPHY PROCEDURE Required

SCENE SAFETY
SUMMON LAW ENFORCEMENT

UNIVERSAL PATIENT CARE PROTOCOL
Remove patient from Stressful environment
Verbal techniques
(Reassurance, calm, establish rapport)

Treat Suspected Problems per Appropriate Protocol
AMS - Overdose - Head Trauma - Hypoglycemia

Agitation – Not Violent
Risk to Self or others
RESTRAINT PROCEDURE
HALOPERIDOL (HALDOL)
5 mg IM ONLY
Over Age 65 Give 2.5 mg IM ONLY
AND
MIDAZOLAM (VERSED)
2.5 mg IV / IO or 5 mg IM / IN
OR
LORazepam (ATIVAN)
1 – 2 mg IV / IO / IM / IN

If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)
AEMT with MD Approval

Any time After Injection: If Fasciculations, Extrapyramidal, Symptoms (EPS) Like Dystonia
diphenhydrAMINE (BENADRYL)
25 - 50 mg IV / IM
May Give Prophylactically
Do not mix HALOPERIDOL (HALDOL) and diphenhydramINE (BENADRYL) in the same syringe - Incompatible

CAPNOGRAPHY PROCEDURE Required

Constant reassessment of ABC’s, personal, and patient safety

TRANSPORT to appropriate facility CONTACT receiving facility
CONSULT Medical Direction where indicated APPROPRIATE transfer of care

If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)
AEMT with MD Approval

KETAMINE (KETALAR)
250 mg IM
USE 100 mg / 2 ml Concentration
May Repeat 250 mg IM in 5 min if NO RESPONSE

AEMT with MD Approval

If Signs of Emergence After KETAMINE Administer
MIDAZOLAM (VERSED)
2.5 mg IV / IO or 5 mg IM / IN
OR
LORazepam (ATIVAN)
1 – 2 mg IV / IO / IM / IN

If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)
Notify receiving Physician Ketamine (Ketalar) administered so patient presentation is not misconstrued as other etiology
AEMT with MD Approval

CAPNOGRAPHY PROCEDURE Required

CONTACT Medical Direction where indicated APPROPRIATE transfer of care

AEMT Intervention
PARAMEDIC Intervention

<td>• Substance abuse / overdose</td>
<td>• Expression of suicidal / homicidal thoughts</td>
<td>• Withdrawal syndromes</td>
</tr>
<tr>
<td>• Diabetes</td>
<td></td>
<td>• Depression</td>
</tr>
</tbody>
</table>

### Agitated – Non-Combative

Patient is experiencing a period of high anxiety seemingly from a psychiatric event not otherwise treatable by EMS who is not a treat to self or others

### Combative – Not Violent

Patient is a treat to self or others and can be controlled and restrained with appropriate help without significant risk to the providers

### Combative – Violent

Patient is in a violent state that puts providers at significant risk despite appropriate help

**Criteria for Restraint Use:**

- Patient out of control and may cause harm to self or others.
- Necessary force required for patient control without causing harm.
- Position of patient must not impede airway or breathing.
- Restraints must not impede circulation.
- Place mask on patient for body secretion protection. May use TB mask, or Non-rebreather if patient needs oxygen.
- Use supine or lateral positioning ONLY.
- MSP checks are required every 15 min.
- DOCUMENT methods used.

**Criteria for medication use for anxiolyis / combative patients:**

- Patient out of control and may cause harm to self or others.
- Patient is NOT a medical patient (treat underlying causes).
- Patient is an ADULT patient.
- Ketamine (Ketalar) or Haloperidol (Haldol) can be given safely without harm to patient or EMS.
- Use necessary force required for patient control without causing harm.
- Position of patient must not impede airway or breathing.
- DOCUMENT methods used.

### Emergence Symptoms

<table>
<thead>
<tr>

<td>Altered LOC</td>
</tr>
</tbody>
</table>

### KEY POINTS

- Exam: Mental Status, Skin, Heart, Lungs, Neuro
- All psychiatric patients must have medical clearance at a hospital ED before transport to a mental health facility.
- Your safety first!!
- Be sure to consider all possible medical / trauma causes for behavior. (Hypoglycemia, overdose, substance abuse, hypoxia, head injury, seizure, etc.)
- Do not irritate the patient with a prolonged exam.
- Do not overlook the possibility of associated domestic violence or child abuse.
- The safety of on scene personnel is the priority. Protect yourself and others by summoning law enforcement to assure everyone’s safety and if necessary, to enable you to render care. Do not approach the patient if he / she is armed with a weapon.
- Consider the medical causes of acute psychosis. Causes may include head trauma, hypoglycemia, acute intoxication, sepsis, CNS insult and hypoxia.
- Suicide ideation or attempts must be transported for evaluation.
- Be alert for rapidly changing behaviors.
- Limit patient stimulation and use de-escalation techniques.
- If the patient has been placed in handcuffs by a law enforcement agency, then a member from that agency MUST ride with the patient in the ambulance to the hospital.
- Consider treatment of agitation / anxiety combativeness for patients requiring restraint procedure.
- Use of Ketamine (Ketalar) and / or Midazolam (Versed) for behavioral emergencies by AEMTs requires training and approval from the agencies Medical Director before they can use the medications off-line.
- Ketamine use in pregnancy is a risk / benefit assessment per case. Consult Medical Direction if there are questions.
DIABETIC EMERGENCIES

UNIVERSAL PATIENT CARE PROTOCOL

BLOOD GLUCOSE PROCEDURE

IV PROCEDURE

Glucose < 70 or symptomatic

ORAL GLUCOSE
15 - 37.5 grams
(If Alert with NO Vascular Access)

OR

THIAMINE 100 mg IV or IM
If Chronic Alcoholism or Malnourished

DEXTROSE 10%
Glucose < 40 mg/dl
25 Grams IV / IO
Glucose 40 – 70 mg/dl
12.5 Grams IV / IO

If DEXTROSE 10% is unavailable, see medication section for DEXTROSE 50%

OR

If No Vascular Access
GLUCAGON (GLUCAGEN)
1 mg IM

Recheck Blood Glucose Level

May Repeat Medications in 5 - 20 Minutes if Still Hypoglycemic

Monitor and Reassess

12 LEAD EKG PROCEDURE

NORMAL SALINE
20 ml / kg if signs / symptoms of Dehydration and NO Contraindications

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care
**DIABETIC EMERGENCIES**

### HYPOGLYCEMIA

<table>

<td>• Altered level of consciousness / coma&lt;br&gt; • Abdominal pain&lt;br&gt; • Nausea / vomiting&lt;br&gt; • Dehydration&lt;br&gt; • Frequent thirst and urination&lt;br&gt; • General weakness malaise&lt;br&gt; • Hypovolemic shock&lt;br&gt; • Hyperventilation&lt;br&gt; • Deep / rapid respirations</td>
<td>• ETOH&lt;br&gt; • Toxic overdose&lt;br&gt; • Trauma&lt;br&gt; • Seizure&lt;br&gt; • Syncope&lt;br&gt; • CNS disorder&lt;br&gt; • Stroke&lt;br&gt; • Diabetic ketoacidosis</td>
</tr>
</tbody>
</table>

Hypoglycemic patients who are receiving oral hypoglycemics should be STRONGLY urged to be transported to the hospital. The half-life of such oral medications is long, and these patients will need to be closely monitored for recurrent hypoglycemia.

**KEY POINTS**

**Hyperglycemia:**
- Diabetic ketoacidosis (DKA) is a complication of diabetes mellitus. It can occur when insulin levels become inadequate to meet the metabolic demands of the body for a prolonged amount of time (onset can be within 12 - 24 hours). Without enough insulin, the blood glucose increases, and cellular glucose depletes. The body removes excess blood glucose by dumping it into the urine. Pediatric patients in DKA should be treated as hyperglycemic under the Pediatric Diabetic Emergency Protocol.
- Patients can have hyperglycemia without having DKA.

**Hypoglycemia:**
- Always suspect hypoglycemia in patients with an altered mental status.
- If a blood glucose analysis is not available, a patient with altered mental status and signs and symptoms consistent with hypoglycemia should receive Dextrose or Glucagon (Glucagen).
- Dextrose is used to elevate BGL but it will not maintain it. The patient will need to follow up with a meal (carbs), if not transported to a hospital.

**Miscellaneous:**
- If IV access is successful after Glucagon (Glucagen) IM and the patient is still symptomatic, Dextrose IV / IO can be administered.
- For alcoholic or malnourished patients, give 100 mg Thiamine IV or IM before giving glucose to avoid possible Wernicke’s encephalopathy.
- Shut off wearable insulin pumps if patient is hypoglycemic.
- Treat if the patients’ blood glucose is 70 or less, or any level with signs and symptoms.
**ADULT PROTOCOL**

**DIALYSIS / RENAL PATIENT**

<table>
<thead>

<tr>
<td></td>
<td>Dysrhythmias</td>
<td></td>
</tr>
</tbody>
</table>

**KEY POINTS**

The chronic renal dialysis patient has numerous medical problems. The kidneys help maintain electrolyte balance, acid-base balance and rid the body of metabolic waste. Kidney failure results in a build-up of toxins within the body, which can cause many problems.

Dialysis is a process, which filters out the toxins, excess fluids and restores electrolyte balance. The process may be done in two ways:

1. **Peritoneal Dialysis**
   Toxins are absorbed by osmosis through a solution infused into the peritoneal cavity; and then drained out. The solution is placed into the abdomen by means of a catheter, which is placed below the navel. This process must be done frequently, as frequently as every 12 hours for a period of 1 - 2 hours.

2. **Hemodialysis**
   Removes toxins by directly filtering the blood using equipment that functions like an electric kidney, circulating the blood through a Shunt that is connected to a vein and an artery. This process usually needs to be done every 2 - 3 days for a period of 3 - 5 hours. A permanent shunt can be surgically formed as a fistula.

**POSSIBLE COMPlications OF DIALYSIS TREATMENT**

1. **Hypotension** (15-30%)
   - May result in angina, MI, dysrhythmia, altered mental status, and seizure
2. **Removal of therapeutic medications**
   - Example: Tegretol
3. **Disequilibrium syndrome**
   - Cause: shift of urea and / or electrolytes
   - Signs and symptoms: Nausea and / or vomiting, altered mentation, or seizure
4. **Bleeding**
   - These patients are often treated with heparin and they may have a low platelet count
   - Bleeding may be at the catheter site, retro peritoneal, gastrointestinal, or subdural
5. **Equipment malfunctions**
   - Possible air embolus
   - Possible fever or endotoxin

- Do not take blood pressure in arm that has the active shunt.
- T waves must be higher than the QRS to qualify as tall / peaked. A dialysis patient may not respond to drug therapy. A renal patient in full cardiac arrest should be treated according to current ACLS guidelines.
HYPERTHERMIA / HEAT EXPOSURE

 UNIVERSAL PATIENT CARE PROTOCOL
 Document Patient Temperature
 Remove Patient from Heat Source
 Remove Patient Clothing
 Increase Air Flow around Patient

 CAPNOGRAPHY PROCEDURE

 IF HEAT STROKE
 Attempt COOLING BEFORE TRANSPORT but don’t delay
 Coldest water available or ICE water if possible
 Apply ICE PACKS to Patient (Groin, Axilla, and Posterior neck)
 Consider Cooling Collar

 IV / IO PROCEDURE
 HEAT EXAUSTION
 IV Normal Saline Bolus 20 ml / kg

 HEAT STROKE (AMS)
 IF HYPOTENSIVE - IV Normal Saline Bolus
 20 ml / kg
 IF NORMOTENSIVE - IV Normal Saline TKO

 BLOOD GLUCOSE PROCEDURE
 Cardiac Monitor / 12 Lead Procedure
 Monitor and Reassess
 Appropriate Protocol Based on Patient Symptoms

 TRANSPORT to appropriate facility
 CONTACT receiving facility
 CONSULT Medical Direction where indicated
 APPROPRIATE transfer of care

 EMT Intervention | AEMT Intervention | PARAMEDIC Intervention | Online Medical Control
### HISTORY
- Age
- Exposure to increased temperatures and humidity
- Past medical history / medications
- Extreme exertion
- Time and length of exposure
- Poor PO intake
- Fatigue and / or muscle cramping

### SIGNS AND SYMPTOMS
- Altered mental status or unconsciousness
- Hot, dry, or sweaty skin
- Hypotension or shock
- Seizures
- Nausea

### DIFFERENTIAL DIAGNOSIS
- Fever (infection)
- Dehydration
- Medications
- Hyperthyroidism (storm)
- Delirium tremens (DT's)
- Heat cramps
- Heat exhaustion
- Heat stroke
- CNS lesions or tumors

---

#### Heat Exhaustion: Dehydration
- Muscular / abdominal cramping
- General weakness
- Diaphoresis
- Febrile
- Confusion
- Dry mouth / thirsty
- Tachycardia
- BP normal or orthostatic hypotension

#### Heat Stroke: Cerebral Edema
- Confusion
- Bizarre behavior
- Skin hot dry, febrile
- Tachycardia
- Hypotensive
- Seizure
- Coma

---

### KEY POINTS
- Exam: Mental Status, Skin, HEENT, Heart, Lungs, Neuro
- Extremes of age are more prone to heat emergencies (i.e. young and old).
- Predisposed by use of tricyclic antidepressants, phenothiazines, anticholinergic medications, and alcohol.
- Cocaine, amphetamines, and salicylates may elevate body temperatures.
- Sweating generally disappears as body temperature rises
- Intense shivering may occur as patient is cooled.
- **Heat Cramps** consists of benign muscle cramping 2° to dehydration and is not associated with an elevated temperature.
- **Heat Exhaustion** consists of dehydration, salt depletion, dizziness, fever, mental status changes, headache, cramping, nausea and vomiting. Vital signs usually consist of tachycardia, hypotension, and an elevated temperature.
- **Heat Stroke** consists of dehydration, tachycardia, hypotension, elevated temperature, and altered mental status. Requires cooling
- Patients at risk for heat emergencies include neonates, infants, geriatric patients, and patients with mental illness. Other contributory factors may include heart medications, diuretics, cold medications and / or psychiatric medications.
- Heat exposure can occur either due to increased environmental temperatures or prolonged exercise or a combination of both. Environments with temperature > 90° F and humidity > 60% present the most risk.
- Heat stroke occurs when the cooling mechanism of the body (sweating) ceases due to temperature overload and / or electrolyte imbalances. Be alert for cardiac dysrhythmias for the patient with heat stroke.
- In patients with significant hyperthermia (temp > 104° F) begin actively cooling with natural or chemical ice packs applied to the patients’ groin, armpits (axilla), and back of neck.
- Cool patient prior to transport if heat stroke. Coolest water or ice if available.
- Use best cooling options available prior to transport, when feasible cool patient before transport.
- Getting patient wet is most effective, do not delay transport to set up immersion tank, use if already available.
HYPERTENSIVE EMERGENCIES

UNIVERSAL PATIENT CARE PROTOCOL

IV / IO PROTOCOL
Assess Neuro Status – Record and Trend GCS
MEND Stroke Exam

12 LEAD EKG PROCEDURE
1ST Contact to EKG and Transmission < 10 Min

BLOOD GLUCOSE PROCEDURE
Consider Potential Causes

Concurrent Chest Pain? - Refer to ACS Protocol
Concurrent Pulmonary Edema? - Treat Per CHF / Pulmonary Edema Protocol

Discontinuation / Non –Compliance with Anti-Hypertensive Medications) – Supportive Care
Head Trauma (Cushing’s Reflex) – See Head Trauma Protocol
Sympathomimetics (Cocaine, Amphetamines, Etc.) – Supportive Care
Aortic Dissection – Supportive Care / Pain Management
Pre-Eclampsia / Eclampsia – See OB Emergencies

Consult Online Medical Direction
If EMS Needs Consideration of Other Interventions on a Per Case Basis

TRANSPORT
Head Up > 30 Degrees Position

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care
## Hypertensive Emergencies

### History
- Documented hypertension
- Related diseases: diabetes, CVA renal failure, cardiac
- Medications (compliance?)
- Pregnancy

### Signs and Symptoms
- One of these:
  - Systolic BP 220 or greater
  - Diastolic BP 120 or greater
- AND at least one of these:
  - Headache
  - Nosebleed
  - Blurred vision
  - Dizziness

### Differential Diagnosis
- Hypertensive encephalopathy
- Primary CNS Injury (Cushing's response = bradycardia with hypertension)
- Myocardial infarction
- Aortic dissection
- Pre-eclampsia / Eclampsia
- Sympathomimetic ingestion (cocaine)

### Key Points
- Prehospital treatment of hypertension is very conservative because a CVA in progress may be made worse by a drop in B/P following aggressive hypertension treatment.
- Consider treatment ONLY if patient has signs and symptoms of CHF or cardiac chest pain!
- Hypertensive emergencies are life threatening emergencies characterized by an acute elevation in blood pressure AND end-organ damage to the cardiac, CNS or renal systems. These crisis situations may occur when patients have poorly controlled chronic hypertension.
- All symptomatic patients with hypertension should be transported with their head elevated.
- Evidence of neurological deficit includes confusion, slurred speech, facial asymmetry, focal weakness, coma, lethargy, and seizure activity.
- Evidence of cardiac impairment includes angina, jugular vein distention, chest discomfort and pulmonary edema.
- Toxic ingestion such as cocaine may present with a hypertensive emergency.
- Hypertension can be a neuroprotective reflex in patients with increased intracranial pressure.
HYPOTHERMIA

**ADULT PROTOCOL**

**HYPOTHERMIA / FROSTBITE**

<table>
<thead>
<tr>
<th>HISTORY</th>
<th>SIGNS AND SYMPTOMS</th>
<th>DIFFERENTIAL DIAGNOSIS</th>
</tr>
</thead>
</table>
| • Past medical history  
• Medications  
• Exposure to environment even in normal temperatures  
• Exposure to extreme cold  
• Extremes of age  
• Drug use: alcohol, barbiturates  
• Infections / sepsis  
• Length of exposure / wetness | • Cold, clammy  
• Shivering  
• Mental status changes  
• Extremity pain or sensory abnormality  
• Bradycardia  
• Hypotension or shock | • Sepsis  
• Environmental exposure  
• Hypoglycemia  
• CNS dysfunction  
• Stroke  
• Head injury  
• Spinal cord injury |

**KEY POINTS**

- **Exam:** Mental Status, Heart, Lungs, Abdomen, Extremities, Neuro
- Hypothermic / drowning / near drowning patients that appear cold and dead are NOT dead until they are warm and dead, or have other signs of obvious death (putrefaction, traumatic injury unsustainable to life).
- Defined as core temperature < 93.2°F (34°C).
- Extremes of age are most susceptible (i.e. young and old).
- Patients with low core temperatures will not respond to ALS drug interventions. Maintain warming procedure and supportive care. Warming procedures includes removing wet clothing, limiting exposure, and covering the patient with warm blankets if available.
- Do not allow patients with frozen extremities to ambulate.
- Do not attempt to rewarm deep frostbite unless there is an extreme delay in transport, and there is a no risk that the affected body part will be refrozen. Contact medical direction prior to rewarming a deep frostbite injury.
- With temperature less than 86°F (30°C) ventricular fibrillation is common cause of death. Handling patients gently may prevent this.
- If the temperature is unable to be measured, treat the patient based on the suspected temperature.
- Hypothermia may produce severe bradycardia.
- Shivering stops below 90°F (32°C).
- Hot packs can be activated and placed in the armpit and groin area if available.
- Care should be taken not to place the packs directly against the patient's skin.
- Consider withholding CPR if patient has organized rhythm. Discuss with Online Medical Control.
- Patients with low core temperatures may not respond to ALS drug interventions. Discuss ACLS drug use with Online Medical Control in severely hypothermic patients.
- Maintain warming procedure and supportive care. Warming procedures includes removing wet clothing, limiting exposure, and covering the patient with warm blankets if available.
- The most common mechanism of death in hypothermia is ventricular fibrillation. If the hypothermia victim is in ventricular fibrillation, CPR should be initiated. If V-FIB is not present, then all treatment and transport decisions should be tempered by the fact that V-FIB can be caused by rough handling, noxious stimuli or even minor mechanical disturbances, this means that respiratory support with 100% oxygen should be done gently, including intubation, avoiding hyperventilation.
- The heart is most likely to fibrillate between 85 - 88°F (29 - 31°C). Defibrillate VF / VT x1 if no change, perform CPR and defer repeat defibrillation attempts until patient has been rewarmed.
- Do not allow patients with frozen extremities to ambulate.
- Superficial frostbite can be treated by using the patient's own body heat.

## Seizures

### HISTORY

- Reported / witnessed seizure activity
- Previous seizure history
- Medical alert tag information
- Seizure medications
- History of trauma
- History of diabetes
- History of pregnancy

### SIGNS AND SYMPTOMS

- Decreased mental status
- Sleepiness
- Incontinence
- Observed seizure activity
- Evidence of trauma

### Differential Diagnosis

- CNS (head) trauma
- Tumor
- Metabolic, hepatic, or renal failure
- Hypoxia
- Electrolyte abnormality (na, ca, mg)
- Drugs, medications, non-compliance
- Infection / fever
- Alcohol withdrawal
- Eclampsia
- Stroke
- Hyperthermia

### Categories of Seizures

<table>
<thead>
<tr>
<th>Complex = Unconscious</th>
<th>Focal = Partial, Localized</th>
<th>Generalized = All Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple = Conscious</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Simple Focal
- Simple Generalized
- Complex Focal
- Complex Generalized

### Key Points

- Exam: Mental Status, HEENT, Heart, Lungs, Extremities, Neuro
- **Status epilepticus** is defined as two or more successive seizures without a period of consciousness or recovery. This is a true emergency requiring rapid airway control, treatment, and transport.
- **Grand mal seizures** (generalized) are associated with loss of consciousness, incontinence, and possibly tongue trauma.
- **Focal seizures** (petit mal) effect only a part of the body and are not usually associated with a loss of consciousness.
- For any seizure in a pregnant patient, follow the OB Emergencies Protocol and call Online Medical Control
- Benzodiazepine administration is reserved for patients who are actively seizing only, not for prophylaxis of seizures.
- Be prepared to manage the airway and breathing of patients who have received benzodiazepines such as Lorazepam (Ativan) or Midazolam (Versed)
- Jacksonian seizures are seizures that start as a focal seizure and become generalized.
- Be prepared for airway problems and continued seizures.
- Assess possibility of occult trauma and substance abuse. Lorazepam (Ativan) is well absorbed when administered IM but takes up to 15 minutes to act. It should be given IV or intranasally (IN) with an atomizer.
- The seizure has usually stopped by the time the EMS personnel arrive and the patient will be found in the postictal state.
- There are many causes for seizures including epilepsy, head trauma, tumor, overdose, infection, hypoglycemia, and withdrawal. Be sure to consider these when doing your assessment.
- Routinely assess the patient’s airway.
- If the patient is combative and postictal, DO NOT use the Restraint Procedure before assessing for / treating hypoglycemia and hypoxia.
- If the patient is actively seizing, move any objects that may injure the patient. Protect, but do not try to restrain them.
SEVERE PAIN MANAGEMENT

PATIENT HAS:
- Burns
- Intractable Flank Pain
- Intractable Back Pain
- Musculoskeletal and/or Fracture Pain
- Sickle Cell Crisis (Use Supplemental O₂)
- Unremitting Abdominal Pain (NOT OB)

fentaNYL (SUBLIMAZE)
25 – 100 mcg IV / IO / IM / IN
May repeat q5 mins - Maximum 100 mcg

Preferred analgesic for trauma / ACS
Push slow IV / IO
If Fentanyl (Sublimaze) is unavailable, see medication section for Morphine Sulfate

HYDROmorphine (DILAUDID)
0.5 – 1 mg IV / IO / IM.
May repeat q10 mins - May Repeat to a Max 2 mg
HALF DOSE > 65, Liver or Renal Disease

Preferred analgesic for intractable / unremitting pain
If HYDROmorphine (Dilaudid) is unavailable, see medication section for Morphine Sulfate

KETAMINE (KETALAR)
10 mg IV / IO / IM / IN
May repeat q5 mins - Up to 30 mg
\[10 \text{ mg} \times \text{ ml}\]

KETOROLAC (TORADOL)
15 mg IV / IO – 1 DOSE LIMIT
30 mg IM – 1 DOSE LIMIT

Consider as needed for Nausea / Vomiting
ONDANSETRON (ZOFRAN) 4 mg IV / IM
OR
PROMETHAZINE (PHENERGAN)
12.5 mg IV / 25 mg IM

Consider ONDANSETRON (Zofran)
Orally Disintegrating Tablet
4 mg Oral – may repeat max 8 mg

CAPNOGRAPHY PROCEDURE
Monitor Airway, Breathing, Vitals

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated

The Wong-Baker Faces Pain Rating Scale

Designed for children aged 3 years and older, the Wong-Baker Faces Pain Rating Scale is also helpful for elderly patients who may be cognitively impaired. It offers a visual description for those who don’t have the verbal skills to explain how their symptoms make them feel.

To use this scale, your doctor should explain that each face shows how a person in pain is feeling. That is, a person may feel happy because he or she has no pain (hurt), or a person may feel sad because he or she has some or a lot of pain.

A Numerical Pain Scale

A numerical pain scale allows you to describe the intensity of your discomfort in numbers ranging from 0 to 10 (depending on the scale). Rating the intensity of sensation is one way of helping your doctor determine treatment. Numerical pain scales may include words or descriptions to better label your symptoms, from feeling no pain to experiencing excruciating pain. Some researchers believe that this type of combination scale may be most sensitive to gender and ethnic differences in describing pain.

KEY POINTS

• Exam: Mental Status, Area of Pain, Neuro
• Pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage.
• Pain is subjective (whatever the patient says it is).
• Pain severity (0-10) is a vital sign to be recorded pre, and post medication delivery and at disposition.
• Use analgesia for suspected cardiac chest pain within the ACS protocol.
• Abdominal pain patients must have a 12 lead EKG to rule out cardiac involvement.
• Vital signs should be obtained pre, 10 minutes post, and at disposition with all pain medications.
• Contraindications to HYDROmorphine (Dilaudid), or FentanyL (Sublimaze) use include hypotension, head injury, respiratory distress or severe COPD.
• All patients should have drug allergies documented prior to administering pain medications.
• All patients who receive pain medications must be observed 15 minutes for drug reaction.
• All patients who receive medication for pain must have continuous ECG monitoring, pulse oximetry, and oxygen administration.
• The patient’s vital signs must be routinely reassessed.
• Routine assessments and reassessments must be documented on the run report.
• Have Naloxone (Narcan) on hand if the patient has respiratory depression or hypotension after HYDROmorphine (Dilaudid), or FentanyL (Sublimaze) administration. Be prepared to ventilate.
• DO NOT administer narcotic analgesics if there is any suspicion of a head injury.
• Capnography is required if patient already has narcotic analgesics on board prior to supplementation.
• Capnography is required if second doses of narcotic analgesics are required to control the patient’s pain.
• Consider asking patient history of opiate addiction – consider non-narcotic options.
• Ketamine use in pregnancy is a risk / benefit assessment per case. Consult Medical Direction if there are questions.
### HISTORY
- Previous CVA, TIA’s
- Previous cardiac / vascular surgery
- Associated diseases: diabetes, hypertension, CAD
- Atrial fibrillation
- Medications (blood thinners)
- History of trauma

### SIGNS AND SYMPTOMS
- Altered mental status
- Weakness / paralysis
- Blindness or other sensory loss
- Aphasia
- Syncope
- Vertigo / dizziness
- Vomiting
- Headache
- Seizures
- Respiratory pattern change
- Hyper / hypotension

### DIFFERENTIAL DIAGNOSIS
- See Altered Mental Status
- TIA (transient ischemic attack)
- Seizure
- Hypoglycemia
- Stroke
- Thrombotic
- Embolic
- Hemorrhagic
- Tumor
- Trauma

---

**Determine the following – Notify Receiving Hospital and Document**

**Identify Last Time Known Normal and the Associated Clinical Story**

*Determine if patient is on any blood thinner medications*

Apixaban (Eliquis), Dabigatran (Pradaxa), Edoxaban (Savaysa), Fondaparinux (Arixtra), Rivaroxaban (Xarelto), Warfarin (Coumadin, Jantoven), Betrixaban (Bevyxxa)

---

**KEY POINTS**

- Exam: Mental Status, HEENT, Heart, Lungs, Abdomen, Extremities, Neuro
- Onset of symptoms is defined as the last witnessed time the patient was symptom free. (i.e. awakening with stroke symptoms would be defined as an onset time of the previous night when patient was symptom free)
- The differential diagnosis listed on the Altered Mental Status Protocol should also be considered.
- Elevated blood pressure is commonly present with stroke. Treat chest pain / discomfort per ACS protocol.
- Be alert for airway problems (swallowing difficulty, vomiting, diminished or absent gag reflex).
- Hypoglycemia can present as a localized neurological deficit, especially in the elderly.
- Patients who experience transient ischemic attack (TIA) develop most of the same signs and symptoms as those who are experiencing a stroke. The signs and symptoms of TIA’s can last from minutes up to one day. Thus, the patient may initially present with typical signs and symptoms of a stroke, but those findings may progressively resolve. The patient needs to be transported, without delay, to the most appropriate hospital for further evaluation.
- Document the time of onset for the symptoms, or the last time the patient was seen “normal” for them.
- Reassess neurological deficit every 10 minutes and document the findings. Evidence of neurological deficit includes confusion, slurred speech, facial asymmetry and focal weakness, coma, lethargy, aphasia, dysarthria, and seizure activity.
- Hypertensive emergencies are life threatening emergencies characterized by an acute elevation in blood pressure AND end-organ damage to the cardiac, CNS or renal systems. These crisis situations may occur when patients have poorly controlled chronic hypertension or stroke.
- Document pts GCS score.
- Check patient’s pupils and rule out head trauma.
- All symptomatic patients with hypertension should be transported with their head elevated.
- Hypertension can be a neuroprotective reflex in patients with increased intracranial pressure.
ADULT PROTOCOL

TOXIC INGESTION / EXPOSURE / OVERDOSE

UNIVERSAL PATIENT CARE PROTOCOL

AIRWAY PROTOCOL
Monitor Lung Sounds for Fluid Overload

OXYGEN

IV / IO PROCEDURE
Apply Cardiac Monitor and Assess Vitals

CAPNOGRAPHY PROCEDURE

Decontaminate and remove clothes if patient is exposed to any dangerous or noxious substances

If Suspected Carbon Monoxide (CO) or Cyanide Poisoning see Specific Protocol

Narcotic Overdose
AMS / Respiratory Depression

Tricyclic Anti – Depressants / Sodium Channel Blocker

Patient on any TRICYCLIC listed below or otherwise with QRS > 0.12
Adapin Doxepin
Anafanril Clomipramine
Elavil Amitriptyline
Endep Maprotiline
Ludiomil Desipramine
Norpramin Droxepin
Pamelor Nortryptiline
Pertofrane Trimipramine
Sinequon Imipramine
Surmontil Protriptyline
Tofranil Benadryl
Vivactil Diphenhydramine

SODIUM BICARBONATE
1 mEq / kg SLOW IV / IO
Until QRS narrows / condition improves
If no improvement contact ONLINE MEDICAL CONTROL

TREAT PPE PRECAUTIONS
GLOVES / MASK minimum Contact / aerosol risk with fentanyl-based substances

ASSURE BLS VENTILATION WITH BVM
Support Hemodynamically Utilize Shock Protocol

NALOXONE (NARCAN)
2 – 4 mg IN Atomized SUMMON ALS IF NO RESPONSE TO IN DOSE

NALOXONE (NARCAN)
1 - 2 mg IV / IM / IO
May repeat every 2 min as necessary if obvious or suspected opiate OD until respiratory improvement or 12 mg Max

If patient is unresponsive to Naloxone (Narcan), supply is exhausted, or the medication is unavailable, consider Advanced Airway and Support Hemodynamically

CAPNUCTANCEOUS PACING PROCEDURE

IV NORMAL SALINE BOLUS
20 ml / kg
To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable

EPINEPHrine (Adrenaline)
PUSH DOSE
Make 10 mcg / ml
10 mcg (1 ml) every 2 - 5 min - slow push
Titrated to effect
To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable

ATROPINE
1 mg IV / IO
Repeat every 3 – 5 Minutes or as needed to control secretions

TREAT with specific antidote

Calcium Channel Blockers OD
CALCIUM GLUCONATE
1 – 3 Grams IV / IO
OR
CALCIUM CHLORIDE
1 Gram IV / IO

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

EMT Intervention

AEMT Intervention

PARAMEDIC Intervention

### TOXIC INGESTION / EXPOSURE / OVERDOSE

#### HISTORY
- Ingestion or suspected ingestion of a potentially toxic substance
- Substance ingested, route, quantity
- Time of ingestion
- Reason (suicidal, accidental, criminal)
- Available medications in home
- Past medical history, medications

#### SIGNS AND SYMPTOMS
- Mental status changes
- Hypo / hypertension
- Decreased respiratory rate
- Tachycardia, dysrhythmias
- Seizures

#### DIFFERENTIAL DIAGNOSIS
- Tricyclic antidepressants (TCAs)
- Acetaminophen (Tylenol)
- Depressants
- Stimulants
- Anticholinergic
- Cardiac medications
- Solvents, alcohols, Cleaning agents
- Insecticides (organophosphates)
- Respiratory depression
- Other organophosphates
- Carbamates

#### COMMON BETAL BLOCKERS
| Acetutolol | Carvedilol | Labetolol | Propranolol |
| Atenolol | Coreg | Levatol | Sectral |
| Betapace | Corgard | Lopressor | Sotalol |
| Betaxolol | Esmolol | Metoprolol | Tenormin |
| Bisoprolol | Inderal | Nadolol | Timolol |
| Brevibloc | Innopran XL | Nebivolol | Trandate |
| Bystolic | Kerlone | Pindolol | Zabeta |

#### COMMON CALCIUM CHANNEL BLOCKERS
| Acalas | Cardene | Lacidipine | Nitripin |
| Adalat | Cardif | Lacilip | Nivalid |
| Amlodipine | Cardizem | Landel | Norvasc |
| Aranidipine | Clinidipine | Lercanidipine | Plendil |
| Atelc | Cinalong | Madipline | Prandipine |
| Azelnidipine | Clevidipine | Manidipine | Procardia |
| Bannidine | Clevidipre | Motens | Procorum |
| Baylotensin | Coniel | Nicardipine | Sapresta |
| Baymycard | Diltiazem | Nifedipine | Siscard |
| Benidipine | Efondipine | Nilvadipine | Sular |
| Calan | Felodipine | Nimodipine | Syccor |
| Calblock | Gallopamil | Nimotop | Verapamil |
| Calslot | HypoCa | Nisoldipine | Zanidip |
| Carden SR | Isopit | Nitrendipine |

#### KEY POINTS
- Exam: Mental Status, Skin, HEENT, Heart, Lungs, Abdomen, Extremities, Neuro
- Do not rely on patient history of ingestion, especially in suicide attempts.
- Bring bottles, contents, and emesis to ED.
- Tricyclic: 4 major areas of toxicity: seizures, dysrhythmias, hypotension, decreased mental status or coma; rapid progression from alert mental status to death.
- Acetaminophen: initially normal or nausea / vomiting. If not detected and treated, causes irreversible liver failure.
- Depressants: decreased HR, decreased BP, decreased temperature, decreased respirations, non-specific pupils.
- Stimulants: increased HR, increased BP, increased temperature, dilated pupils, and seizures.
- Anticholinergics: increased HR, increased temperature, dilated pupils, and mental status changes.
- Cardiac Medications: dysrhythmias and mental status changes.
- Solvents: nausea, vomiting, and mental status changes.
- Insecticides: increased or decreased HR, increased secretions, nausea, vomiting, diarrhea, pinpoint pupils.
- Consider restraints if necessary for patient’s and / or personnel’s protection per the Restriction Procedure.
- If it can be done safely, take whatever container of the substance came from to the hospital along with readily obtainable samples of medication unless this results in an unreasonable delay of transport.
- If applicable, DO NOT transport a patient to the hospital until properly decontaminated.
- Naloxone (Narcan) administration may cause the patient to go into acute opiate withdraw, which includes vomiting, agitation, and / or combative behavior. Always be prepared for combative behavior.
- Naloxone (Narcan) goal is to reverse life threatening respiratory depression
- Naloxone (Narcan) may wear off in as little as 20 minutes causing the patient to become more sedate and possibly hypoventilate. All A&O 4 patients having received Naloxone (Narcan) should be transported. If patient refuses transport, contact Online Medical Control before release.

#### POISON CONTROL 1-800-222-1222
**ADULT PROTOCOL**

**TOXIC INHALATION / INGESTION CYANIDE**

**POTENTIAL EXPOSURES**

Smoke Inhalation

Intentional or unintentional poisoning or ingestion of Laetrile (vitamin B17) or multiple fruit pits.

Industrial exposure such as metal plating and recovery, plastics, industrial uses of hydrogen cyanide or medical complications from the use of sodium nitroprusside.

**UNIVERSAL PATIENT CARE PROTOCOL**

Cyanide Ingestion or Inhalation

Immediately Remove From Continued Exposure Avoid Exertion to Limit Tissue Oxygen Demand Determine Exposure Time

**APPLY HIGH FLOW OXYGEN**

CAPNOGRAPHY PROCEDURE

Secure Airway If Comatose or Compromised Airway

**INTUBATION PROCEDURE**

Extraglottic (BIAD) AIRWAY Device

**CARDIAC MONITORING PROCEDURE**

**PULSE OXIMETRY**

PULSE CO-OXIMETRY (If Available)

**IV / IO PROCEDURE**

To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable

Place 2 IV’s Draw blood sample if considering / supplied with Hydroxocobalamin (Cyanokit)

**EPINEPHrine (Adrenaline)**

PUSH DOSE

Make 10 mcg / ml

10 mcg (1 ml) every

2 - 5 min - slow push

Titrated to effect

To Maintain MAP > 65 or SBP 90 / Radial Pulses if NIBP Unavailable

If Continued Hypotension

**TRANSPORT** to appropriate facility

**CONTACT** receiving facility

**CONSULT** Medical Direction where indicated

**APPROPRIATE** transfer of care

Aggressive airway management with delivery of 100% oxygen can be lifesaving. Supportive care with administration of oxygen alone has proven effective in a number of poisonings. It can also treat potential simultaneous CO exposure.

**EMT Intervention**

**AEMT Intervention**

**PARAMEDIC Intervention**

**Online Medical Control**

TOXIC INHALATION / INGESTION
CYANIDE

HISTORY

- Inhalation or ingestion of cyanides
- Duration of exposure
- Reason (suicidal, accidental, criminal)
- Past medical history, medications

SIGNS AND SYMPTOMS

- Malaise, fatigue, drowsiness
- Reddened skin
- Dyspnea
- Chest pain
- Nausea / vomiting
- Abdominal pain
- Dizziness / vertigo
- Memory disturbances
- Syncope
- Seizures
- Coma

DIFFERENTIAL DIAGNOSIS

- Flu / severe cold
- Chronic fatigue
- Migraine
- Myocardial infarction / ACS
- Encephalitis
- Anaphylaxis
- Other ingested toxins
- Pulmonary embolism

POISON CONTROL 1-800-222-1222

KEY POINTS

- Exam: Mental Status, Skin, HEENT, Heart, Lungs, Abdomen, Extremities, Neuro
- Cyanide is generally considered to be a rare source of poisoning.
- Cyanide exposure occurs relatively frequently in patients with smoke inhalation from fires.
- Numerous forms of cyanide exist, including gaseous hydrogen cyanide (HCN), water-soluble potassium and sodium cyanide salts, and poorly water-soluble mercury, copper, gold, and silver cyanide salts.
- Several synthesized (polyacrylonitrile, polyurethane, polyamide, urea-formaldehyde, melamine) and natural (wool, silk) compounds produce HCN when burned.
- Industry widely uses nitriles as solvents and in the manufacturing of plastics. Nitriles may release HCN during burning or when metabolized following absorption by the skin or gastrointestinal tract.
- Cyanide poisoning also may occur in other industries, particularly in the metal trades, mining, electroplating, jewelry manufacturing, and x-ray film recovery.
- Depending on its form, cyanide may cause toxicity through parenteral administration, inhalation, ingestion, or dermal absorption.
- Rapid aggressive therapy, consisting of supportive care and antidote administration, is lifesaving.
- The delay between exposure and onset of symptoms depends on type of cyanide involved, route of entry, and dose. Rapidity of symptom onset, depending on the type of cyanide exposure, occurs in the following order (most rapid to least rapid): gas, soluble salt, insoluble salt, and cyanogens.
**UNIVERSAL PATIENT CARE PROTOCOL**

**Known or Suspected Carbon Monoxide Poisoning**

- Immediately Remove From Continued Exposure
- Avoid Exertion to Limit Tissue Oxygen Demand
- Determine Exposure Time

**APPLY HIGH FLOW OXYGEN**

**CPAP PROCEDURE if CO >10%**

</tr>
</tbody>
</table>

### CO Levels

- <10% Mild
- 10% - 20% Moderate
- >20% Severe

Special Considerations for Pregnant Females and Children

### Key Points

- Exam: Mental Status, Skin, HEENT, Heart, Lungs, Abdomen, Extremities, Neuro
- Consider CO poisoning with any patient exposed to products of combustion.
- Causes and exposure may include malfunctioning gas appliances, vehicle exhaust, improper use of gas burning heaters, animal dung, environmental waste and fires.
- Normal CO levels do not necessarily mean there was not CO poisoning. This is especially true if the patient has already received extensive oxygen therapy.
- Patients that show signs and symptoms at lower CO levels include: pregnant females, infants, children and the elderly.
- Vitals may be normal but could be tachycardic, hypo or hypertensive.
- Cherry red skin is rarely seen.
- PREGNANT patients are special circumstances as the affinity for fetal hemoglobin to carbon monoxide is very high and therapy including hyperbaric care is considered early on.
- Patients that demonstrate altered mental status may NOT sign refusals for treatment or transport.
- Known or suspected CO poisoning patients should receive high flow oxygen despite Spo2 readings.
- The use of a pulse oximeter is not effective in the diagnosis of carbon monoxide poisoning, as patients suffering from carbon monoxide poisoning may have a normal oxygen saturation level on a pulse oximeter.
- **Pulse oximetry is still used on all CO poisonings as hypoxia in addition to the CO represents serious compounding respiratory issues possibly from other causes.**
- Pulse CO-oximeters estimate carboxyhemoglobin levels with a non-invasive finger clip similar to a pulse oximeter.
SECTION 6 - TRAUMA PROTOCOLS

Trauma Emergencies .................................................................................................................. 2-6
Trauma Guidelines ................................................................................................................... 3-6
NOTS Field Triage (Hospital Determination) ........................................................................... 5-6
Abdominal Trauma .................................................................................................................. 6-6
Burns ........................................................................................................................................ 8-6
Chest Trauma .......................................................................................................................... 10-6
Drowning / Near Drowning ...................................................................................................... 12-6
Extremity / Amputation Trauma .............................................................................................. 14-6
Head Trauma ........................................................................................................................... 16-6
Maxillofacial Trauma ............................................................................................................... 18-6
Multiple Trauma ..................................................................................................................... 20-6
Trauma Arrest ......................................................................................................................... 22-6
Glasgow Coma Scale ............................................................................................................... 23-6
Revised Trauma Score ............................................................................................................ 23-6
Rule of Nines – Burn Chart ..................................................................................................... 24-6
INDICATIONS

- Uncorrectable airway obstruction
- Tension pneumothorax
- Pericardial tamponade
- Penetrating chest wounds with signs of shock
- Hemothorax with signs of shock
- Head trauma with unilaterally dilated pupils
- Head trauma with rapidly deteriorating condition
- Unconsciousness

KEY POINTS

- A trauma victim is considered to be a pediatric patient if they are 15 years old or younger.
- Once the patient is determined to be an actual or potential major trauma / multiple system patient, personnel on scene and / or medical control must quickly determine the appropriate course of action including:
  1. Requesting aeromedical evacuation from scene. See AEROMEDICAL TRANSPORT PROCEDURE.
  2. Ground transportation directly to an appropriate facility.
- Major trauma patients are to be transported to the closest Trauma Center.
- Contact the receiving hospital for all major trauma or critical patients.
- Cover open wounds, burns, and eviscerations.
- With the exception of airway control, initiate ALS enroute when transporting major trauma patients.
- If the EMT is unable to access patient airway and ventilate, transport to the closest facility for airway stabilization.
- The on scene time for major trauma patients should not exceed 10 minutes without a documented, acceptable reason for the delay.
- All major trauma patients should receive oxygen administration, an IV(s), and cardiac monitoring.
- Provide a documented reason if an intervention could not be performed.

Mass Casualty Incidents (MCI)

- Upon arrival at a MCI, the first arriving unit should notify their dispatch of the need to implement the mass casualty plan, call for additional resources, establish a safe staging area, and estimate the total number of victims.
- Each EMS service has a pre-defined coordinating facility based on their county’s mass casualty plan. It is the responsibility of the responding jurisdiction to notify their appropriate coordinating hospital as soon as possible, giving a brief description of the incident and the estimated number of victims. The coordinating facility will then notify the receiving hospitals of the MCI. The transportation officer should maintain a constant contact with the coordinating facility until the scene has been cleared of salvageable victims.
- Refer to the county MCI protocol

THE GOLDEN PERIOD FOR THE PATIENT BEGINS WHEN THE TRAUMA HAPPENS
DO NOT WASTE VALUABLE TIME ON SCENE
Emergency medical service personnel shall use the following criteria, consistent with their certification, to evaluate whether an injured person qualifies as an adult trauma victim or pediatric trauma victim, in conjunction with the definition of trauma per the State of Ohio Trauma Triage Guidelines.

**An Adult Trauma Victim is a person 16 years – 64 years exhibiting one or more of the following physiologic or anatomic conditions:**

<table>
<thead>
<tr>
<th>Physiologic conditions</th>
<th>Anatomic conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Glasgow Coma Scale less than or equal to 13;</td>
<td>• Penetrating trauma to the head, neck, or torso;</td>
</tr>
<tr>
<td>• Loss of consciousness greater than 5 minutes;</td>
<td>• Significant, penetrating trauma to extremities proximal to the knee or elbow with evidence of neurovascular compromise;</td>
</tr>
<tr>
<td>• Deterioration in level of consciousness at the scene or during transport;</td>
<td>• Injuries to the head, neck, or torso where the following physical findings are present:</td>
</tr>
<tr>

<tr>
<td></td>
<td>o Evidence of neurovascular compromise.</td>
</tr>
</tbody>
</table>

- Signs or symptoms of spinal cord injury;
- 2nd or 3rd Degree > 10% total BSA, or other significant burns involving the face, feet, hands, genitalia, or airway.
- Open skull injury
- Pedestrian struck by motor vehicle
- Fall from any height, including standing, with evidence of traumatic brain injury.
- Vehicle telemetry data consistent with a high risk for injury
Field Trauma Triage Criteria: Mechanism of Injury (MOI) & Special Considerations

Co-Morbid Diseases and Special Considerations:
- Age < 5 or > 55
- Cardiac disease
- Respiratory disease
- Diabetes
- Immunosuppression
- Morbid obesity
- Pregnancy
- Substance abuse / intoxication
- Liver disease
- Renal disease
- Bleeding disorder / anticoagulation

Mechanisms of Injury (MOI):
- High speed MVC
- Ejection from vehicle
- Vehicle rollover
- Death in same passenger compartment
- Extrication time > 20 minutes
- Falls greater than 20 feet
- Vehicle versus bicycle / pedestrian
- Pedestrian struck, thrown or run over
- Motorcycle crash > 20 mph with separation of rider from bike
- Fall from any height, including standing, with signs of traumatic brain injury

KEY POINTS

Exceptions to Mandatory Transport to a Trauma Center:

- Emergency Medical Service personnel shall transport a trauma victim directly to an adult or pediatric trauma center that is qualified to provide appropriate adult or pediatric care, unless one or more of the following exceptions apply:

  1. It is medically necessary to transport the victim to another hospital for initial assessment and stabilization before transfer to an adult or pediatric trauma center;
  2. It is unsafe or medically inappropriate to transport the victim directly to an adult or pediatric trauma center due to adverse weather or ground conditions or excessive transport time;
  3. Transporting the victim to an adult or pediatric trauma center would cause a shortage of local emergency medical service resources;
  4. No appropriate adult or pediatric trauma center is able to receive and provide adult or pediatric trauma care to the trauma victim without undue delay;
  5. Before transport of a patient begins, the patient requests to be taken to a particular hospital that is not a trauma center or, if the patient is less than eighteen years of age or is not able to communicate, such a request is made by an adult member of the patient’s family or a legal representative of the patient.

**ADULT PROTOCOL**

**NOTS ADULT TRAUMA FIELD TRIAGE**

---

**Step 1 - Measure vital signs and level of consciousness of patient with a traumatic mechanism**
- Glasgow Coma Scale < 13 with traumatic mechanism
- Systolic blood pressure < 90mmHg or
- Respiratory rate < 10 or >29 breaths/minute or requiring airway/ventilator support

**Step 2 - Assess anatomy of injury**
- Significant penetrating injuries to the head, neck, torso or extremities proximal to the elbow or knee
- Presence of suspicion of a flail chest
- Two or more proximal long-bone fractures
- Crushed, degloved, threatened, pulseless or mangled extremity
- Amputation proximal to wrist or ankle
- Pelvic fractures
- Open or depressed skull fracture
- Paralysis

**Step 3 - Assess mechanism of injury and evidence of high-energy impact**
- Falls
  - Adults >10ft (one story is equal to 10 ft.)
- High-risk auto crash
  - Intrusion: including roof: >12 in. occupant site, >18 in. any site
  - Extrication time over 20 minutes
  - Ejection (partial or complete) from automobile
  - Death in same passenger compartment
  - Vehicle telemetry data consistent with high risk of injury
- Auto vs. Pedestrian/Bicyclist thrown, run over or with significant (>20 mph) impact
- Motorcycle crash >20 mph
- Other motorized equipment crashes where the patient has the potential of significant injury

**Step 4 - Assess special patient or system considerations of trauma patients**
- GCS: 12-14 with evidence of traumatic injury
- Age >65 years old to a Trauma Center
- Anticoagulant and bleeding disorders on prescription blood thinners
- Significant burns (+/- trauma mechanism) or inhalation injury, chemical injury electrical injury or frostbite triage to burn center
- Open fractures regardless of location of fracture, except single digit fractures
- Pregnancy >20 weeks gestation
- EMS Provider Judgment: When in doubt transfer to a trauma center

**Step 5 - Patients not meeting above criteria**

---

**NOTS Transfer Line:**
1-216-778-7850

**Scene Referrals**
- **Cleveland Clinic Hospitals**
  1-844-223-3822
- **MetroHealth Medical Center**
  1-800-233-5433
- **University Hospitals**
  1-877-842-3822

**Red/Priority 1**
Take to a trauma center, these patients should be transported preferentially to the highest level of care within the trauma system. If transport to a Level I will add greater than 15 minutes, transport to the nearest trauma facility

**Level I Adult Trauma Centers:**
- MetroHealth Medical Center,
  University Hospitals Cleveland Medical Center
- CCF Akron General

**Level II Adult Trauma Centers:**
- CCF Fairview Hospital
- CCF Hillcrest Hospital

**Level III Adult Trauma Centers:**
- UH Geauga Medical Center
- UH Portage Medical Center
- Southwest Medical Center
- UH St. John Medical Center

**Yellow/Priority 2**
Transport patient to nearest trauma center within trauma system, need not be the highest level of trauma center

**Green/Priority 3**
Transport to the closest appropriate emergency department

---

Northeast Ohio Regional EMS Protocol - 5 | 6
ABDOMINAL TRAUMA

**UNIVERSAL PATIENT CARE PROTOCOL**
- BLEEDING / HEMORRHAGE CONTROL PROCEDURE
- AIRWAY PROTOCOL
- SPINAL MOTION RESTRICTION PROCEDURE
- OXYGEN
- CAPNOGRAPHY PROCEDURE
- Determine if Load & Go

- Evisceration: Cover, clean saline dressing to loosely stabilize
- Penetrating Object: Cover, clean saline dressing – Immobilize object. If too large to transport – attempt to cut with care not to further injure tissue
- Penetrating Wounds: Cover, clean saline dressing. Look for exit wound
- Blunt Trauma: Assess for change – distention. Note mechanism

- **IV / IO PROCEDURE**
  - To Maintain MAP > 65 or SBP 90 (100 systolic if >70 years old) / Radial Pulses if NIBP Unavailable
  - If evidence of current / previous uncontrolled hemorrhage, HR > 120 and / or SBP < 90, within 60 mins of injury
  - Consider TRADEXAMIC ACID (TXA) 1 Gram mixed in 100 ml D5W over 10 mins

- Monitor and Reassess
- INITATE TRAUMA ALERT
- TRANSPORT to appropriate facility
- CONTACT receiving facility
- CONSULT Medical Direction where indicated
- APPROPRIATE transfer of care
ADULT PROTOCOL

KEY POINTS

Trauma to the abdomen is either Blunt or Penetrating. Blunt injuries are harder to detect and diagnose, and have a death rate twice that of penetrating wounds. Key signs and symptoms of blunt trauma include a patient in shock with no obvious injuries. Distention of the abdomen is an indication of internal hemorrhage. Pain may not be a significant factor. Many abdominal trauma injuries are Load & Go cases.

- Look for both an entrance and exit wound for all penetrating trauma, and treat accordingly.
- For all major trauma patients, the on scene time should be less than ten minutes.
UNIVERSAL PATIENT CARE PROTOCOL

CONSIDER SPINAL MOTION RESTRICTION PROCEDURE

AIRWAY PROTOCOL

OXYGEN

CAPNOGRAPHY PROCEDURE

If Chest, Neck, Face, Airway Involvement – Prepare for Invasive Airway Procedures

Perform Early Intubation

CRICOTHYROTOMY - NEEDLE, KIT, or SURGICAL

As provided and trained

In rare circumstances for life saving measures only

Remove rings, bracelets, and other constricting items

Thermal

If burn < 10% body surface area (using rule of nines)

Cool down wound with NORMAL SALINE

Cover burn with dry sterile sheet or dressings

IV / IO PROCEDURE

If Burns ≥ 25% then 60 drops / min (Macrodrip set)

otherwise KVO

SEVERE PAIN PROTOCOL

Chemical

Eye Injury

Continuous flushing with Normal Saline

Remove clothing and / or expose area

Flush area with NORMAL SALINE for 10 – 15 minutes

SEVERE PAIN PROTOCOL

Initiate Trauma Alert

TRANSPORT to appropriate facility

CONTACT receiving facility

CONSULT Medical Direction where indicated

APPROPRIATE transfer of care

EMT Intervention

AEMT Intervention

PARAMEDIC Intervention

Online Medical Control
## HISTORY
- Type of exposure (heat, gas, chemical)
- Inhalation injury
- Time of injury
- Past medical history
- Medications
- Other trauma
- Loss of consciousness
- Tetanus / immunization status

## SIGNS AND SYMPTOMS
- Burns, pain, swelling
- Dizziness
- Loss of consciousness
- Hypotension / shock
- Airway compromise / distress
- Singed facial or nasal hair
- Hoarseness / wheezing

## DIFFERENTIAL DIAGNOSIS
- Superficial (1°) red and painful
- Partial thickness (2°) superficial partial thickness, deep partial thickness, blistering
- Full thickness (3°) painless and charred or leathery skin
- Chemical
- Thermal
- Electrical
- Radiation

### KEY POINTS
- Exam: Mental Status, HEENT, Neck, Heart, Lungs, Abdomen, Extremities, Back, Neuro
- Early intubation is required in significant inhalation injuries with airway compromise.
- Critical Burns: >25% body surface area (BSA); full thickness burns >10% BSA; partial thickness superficial partial thickness, deep partial thickness and full thickness burns to face, eyes, hand or feet; electrical burns; respiratory burns; deep chemical burns; burns with extremes of age or chronic disease; and burns with associated major traumatic injury. These burns may require hospital admission or transfer to a burn center.
- Potential CO exposure should be treated with 100% oxygen.
- Circumferential burns to extremities are dangerous due to potential vascular compromise partial thickness to soft tissue swelling.
- Burn patients are prone to hypothermia – Never apply ice or cool burns that involve >10% body surface area.
- Do not overlook the possibility of multiple system trauma.
- Do not overlook the possibility of child abuse with children and burn injuries.
- See appendix for rule of nines.

1. **Thermal (dry and moist):**
   - a. Stop burning process: i.e. remove patient from heat source, cool skin, remove clothing
   - b. If patient starts to shiver or skin is cool, stop cooling process.
   - c. Estimate extent (%) and depth of burn (see chart). Determine seriousness (see chart) of burn, contact Medical Control and transport accordingly.
     Cover burn areas with sterile dressing.

2. **Radiation Burns:**
   - a. Treat as thermal burns except when burn is contaminated with radioactive source, then treat as chemical burn.
   - b. Wear appropriate protective clothing when dealing with contamination.
   - c. Contact HAZ MAT TEAM for assistance in contamination cases.

3. **Chemical Burns:**
   - a. Wear appropriate protective clothing and respirators.
   - b. Remove patient from contaminated area to decontamination site (NOT SQUAD).
   - c. Determine chemicals involved; contact appropriate agency for chemical information.
   - d. Remove patient’s clothing and flush skin.
   - e. Leave contaminated clothes at scene. Cover patient over and under before loading into squad.
   - f. Patient should be transported by personnel not involved in decontamination process.
   - g. Determine severity (see chart), contact Medical Control and transport accordingly.
   - h. Relay type of substance involved to Medical Control.

4. **Electrical Burns:**
   - a. Shut down electrical source; do not attempt to remove patient until electricity is CONFIRMED to be shut off.
   - b. Assess for visible entrance and exit wounds and treat as thermal burns.
   - c. Assess for internal injury, i.e., vascular damage, tissue damage, fractures, and treat accordingly.
   - d. Determine severity of burn, contact Medical Control and transport accordingly.

5. **Inhalation Burns:**
   - a. Always suspect inhalation burns when the patient is found in closed smoky environment and / or exhibits any of the following: burns to face / neck, singed nasal hairs, cough and / or stridor, soot in sputum.
   - b. Provide oxygen therapy, contact Medical Control and transport.

- Handle patients gently to avoid further damage of the patient’s skin.
- If the patient is exposed to a chemical, whenever possible, get the name of the chemical, and document it on the patient run report. **DO NOT** transport any hazardous materials with the patient.
- Look for signs of dehydration and shock.
- Initiate early intubation for symptomatic patients with inhalation burns.
- Patients with major burns should be transported to the a Regional Burn Center.
- Patients with unstable airway or who are rapidly deteriorating should be transported to the closest appropriate facility.
- Patients with large surface burns lose the ability to regulate their body temperature. Avoid heat loss by covering the patient.
### A D U L T  P R O T O C O L

#### CHEST TRAUMA

**UNIVERSAL PATIENT CARE PROTOCOL**

**BLEEDING / HEMORRHAGE CONTROL PROCEDURE**

**AIRWAY PROTOCOL**

**SPINAL MOTION RESTRICTION PROTOCOL**

**HIGH FLOW OXYGEN**

**CAPNOGRAPHY PROCEDURE**

If S&S of Tension Pneumothorax
(No lung sounds on affected side, Hypotension, JVD)
NEEDLE CHEST DECOMPRESSION PROCEDURE

⚠️ Be Prepared to Repeat IF S&S Return

**IV / IO PROCEDURE**

Normal Saline Bolus to Maintain MAP > 65
or SBP 90 (100 systolic if >70 years old) / Radial Pulses if NIBP Unavailable

If evidence of current / previous uncontrolled hemorrhage,
HR > 120 and / or SBP < 90, within 60 mins of injury
Consider TRANEXAMIC ACID (TXA)
1 Gram mixed in 100 ml D5W over 10 mins

**APPLY CARDIAC MONITOR**

**Cardiac Tamponade:** Assess for Beck’s Triad (Hypotension, +JVD and muffled heart sounds).
Paradoxical Pulse (no radial pulse when breathing in) is likely. LOAD AND GO

**Massive Hemorthorax:** Shock, then difficulty breathing. No JVD, decreased breath sounds, dull to percussion. LOAD AND GO

**Open Pneumothorax / Sucking Chest Wound:** Close wound with occlusive dressing secured on THREE SIDES or Commercial Chest Seal. LOAD AND GO

**Flail Chest:** Assist with Ventilation – Gentle Positive Pressure - Consider CPAP if isolated chest trauma and no hypotension / shock / tension pneumothorax and spontaneous adequate respiration. LOAD AND GO

**Suspected:** Traumatic Aortic Rupture, Tracheal or Bronchial Tree Injury, Myocardial Contusion, Diaphragmatic Tears, Esophageal Injury, And Pulmonary Contusion:
Ensure an Airway, Administer Oxygen, LOAD AND GO

**INITIATE TRAUMA ALERT**

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care

</tbody>
</table>

### KEY POINTS

Thoracic injuries have been called the deadly dozen. The first six are obvious at the primary assessment.

1. Airway obstruction
2. Flail chest
3. Cardiac tamponade
4. Massive hemothorax
5. Open pneumothorax
6. Tension pneumothorax

The second six injuries may be more subtle and not easily found in the field:

7. Traumatic aortic rupture
8. Esophageal injury
9. Myocardial contusion
10. Diaphragmatic tears
11. Tracheal / bronchial tree injury
12. Pulmonary contusion

- A **sucking chest wound** is when the thorax is open to the outside. The occlusive dressing may be anything such as petroleum gauze, plastic, or a defibrillator pad. Tape only 3 sides down so that excess intrathoracic pressure can escape, preventing a tension pneumothorax. May help respirations to place patient on the injured side, allowing unaffected lung to expand easier.

- A **flail chest** is when there are extensive rib fractures present, causing a loose segment of the chest wall resulting in paradoxical and ineffective air movement. Positive pressure breathing via BVM will help push the segment and the normal chest wall out with inhalation and to move inward together with exhalation, getting them working together again. Do not use too much pressure to prevent additional damage or pneumothorax.

- A **penetrating object** must be immobilized by any means possible. If it is very large, cutting may be possible, with care taken not to move it about when making the cut. Place an occlusive and bulky dressing over the entry wound.

- A **tension pneumothorax** is life threatening, look for **HYPOTENSION**, unequal breath sounds, JVD, increasing respiratory distress, and decreasing mental status. The pleura must be decompressed with a needle to provide relief. Decompress between the 2nd and 3rd ribs, midclavicular placing the catheter over the 3rd rib. Alternate site, 5th intercostal space mid axillary or anterior axillary line. Once the catheter is placed, watch closely for reocclusion. Once the catheter is placed, watch closely for reocclusion. Repeat if needed to prevent reocclusion. Decompress with 3.25” 14 ga catheter or Chest Decompression Needle based on patient’s size.
A D U L T  P R O T O C O L
DROWNING / NEAR DROWNING

UNIVERSAL PATIENT CARE PROTOCOL

SPINAL MOTION RESTRICTION PROCEDURE
Place backboard while still in water if able.

AIRWAY PROTOCOL
Initiate ventilation while patient is still in water if not breathing.

IF DECOMPRESSION SICKNESS
Give oxygen – no positive pressure ventilation unless NOT breathing.

OXYGEN ASAP

CAPNOGRAPHY PROCEDURE

Apply Cardiac Monitor

IF HYPOTHERMIC
Treat per HYPOTHERMIA PROTOCOL

IV / IO PROCEDURE
Normal Saline TKO

Monitor and Reassess

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care

EMT Intervention | AEMT Intervention | PARAMEDIC Intervention | Online Medical Control
HISTORY
- Submersion in water regardless of depth
- Possible trauma i.e.; fall, diving board
- Duration of immersion
- Temperature of water
- Salt vs. fresh water

SIGNS AND SYMPTOMS
- Period of unconsciousness
- Unresponsive
- Mental status changes
- Decreased or absent vital signs
- Vomiting
- Coughing

DIFFERENTIAL DIAGNOSIS
- Trauma
- Pre-existing medical problem
- Barotrauma (diving)
- Decompression sickness

KEY POINTS
- Exam: Trauma Survey, Head, Neck, Chest, Abdomen, Pelvis, Back, Extremities, Skin, Neuro
- Drowning due to suffocation from submersion in water.
- 2 causes – breath holding which leads to aspiration of water; & laryngospasm which closes the glottis.
- Both causes lead to profound hypoxia and death.
- Fresh water drowning ventricular fibrillation may be likely.
- Salt water drowning may cause pulmonary edema in time.
- Pulmonary edema can develop within 24 - 48 hours after submersion.
- All victims should be transported for evaluation due to potential for worsening over the next several hours.
- Drowning is a leading cause of death among would-be rescuers.
- Allow appropriately trained and certified rescuers to remove victims from areas of danger.
- With pressure injuries (decompression / barotrauma), consider transport for availability of a hyperbaric chamber.
- All hypothermic / hypothermic / near-drowning patients should have resuscitation performed until care is transferred, or if there are other signs of obvious death (putrification, traumatic injury unsustainable to life).
- A drowning patient is in cardiac arrest after the submersion.
- Consider a c-spine injury in all drowning cases. Always immobilize a drowning patient.
- Patients with low core temperatures will not respond to ALS drug interventions. Maintain warming procedures and supportive care.
- DO NOT perform the Heimlich maneuver to remove water from the lungs prior to resuscitation.
EXTREMITY TRAUMA / AMPUTATION

- UNIVERSAL PATIENT CARE PROTOCOL
- BLEEDING / HEMORRHAGE CONTROL PROCEDURE
  - Risk of Exsanguination?
    - Internally or Externally
  - Upper Extremities Apply Commercial Tourniquet
  - Lower Extremities 2 Commercial Tourniquets
- OXYGEN
- IV / IO PROCEDURE
- SEVERE PAIN MANAGEMENT PROTOCOL
  - \(0\) CAPNOGRAPHY REQUIRED FOR SEDATION / PAIN MANAGEMENT OF TRAUMA PATIENT
  - If evidence of current / previous uncontrolled hemorrhage, \(HR > 120\) and / or \(SBP < 90\), within 60 mins of injury
    - Consider TRANEXAMIC ACID (TXA)
    - 1 Gram mixed in 100 ml D5W over 10 mins
- Amputation?
  - Clean amputated part with normal saline irrigation
  - Wrap part in sterile dressing and place in plastic bag if able
  - Place on ice if available – no direct contact to tissue
- TRANSPORT to appropriate facility
- CONTACT receiving facility
- CONSULT Medical Direction where indicated
- APPROPRIATE transfer of care
# Adult Protocol

## Extremity Trauma / Amputation

### History
- Type of injury
- Mechanism: crush / penetrating / amputation
- Time of injury
- Open vs. closed wound / fracture
- Wound contamination
- Medical history
- Medications

### Signs and Symptoms
- Pain, swelling
- Deformity
- Altered sensation / motor function
- Diminished pulse / capillary refill
- Decreased extremity temperature

### Differential Diagnosis
- Abrasion
- Contusion
- Laceration
- Sprain
- Dislocation
- Fracture
- Amputation

### Key Points
- Exam: Mental Status, Extremity, Neuro
- In amputations, time is critical. Transport and notify medical control immediately, so that the appropriate destination can be determined.
- Hip dislocations and knee and elbow fracture / dislocations have a high incidence of vascular compromise.
- Urgently transport any injury with vascular compromise.
- Blood loss may be concealed or not apparent with extremity injuries.
- Lacerations must be evaluated for repair within 6 hours from the time of injury.

**Extremity Trauma**
- DO NOT take the time to splint injured extremities in major trauma patients unless it does not delay the scene time or prevents you from performing more pertinent patient care.
- Splint the extremity if the patient has signs and symptoms of a fracture or dislocation.
- Treat all suspected sprains or strains as fractures until proven otherwise.
- Splint the joint above and below for all suspected fractures.
- Splint the bone above and below for all suspected joint injuries.
- Check and document the patient’s MSP’s before and after splinting.
- A traction splint with a backboard is the preferred splint to use for femur fractures.

**Traumatic Amputation**
- Care of the amputated extremity include:
  - Cleanse an amputated extremity with normal saline or sterile water.
  - DO NOT place any amputated tissue directly on ice or cold pack. Instead, place the amputated limb into a plastic bag. Put the bag into a container of cool water with a few ice cubes (if available).
- Contact the receiving hospital with the patient information and include the status of the amputated limb.
- Focus on patient care and not on the amputated extremity.
- Tourniquets should be applied early if there is a risk of exsanguination (bleeding out) from extremity injury.
- Remember to calm and reassure the patient. Do not give the patient or their family member’s false hope of re-attachment of the affected limb. A medical team at the receiving hospital makes this decision.
- Delegate someone to do an on-scene search for the amputated part when it cannot be readily found and continue with patient care.
**Head Trauma**

**Universal Patient Care Protocol**
- Oxygen for all head trauma

**Spinal Motion Restriction Procedure**

**Bleeding / Hemorrhage Control Procedure**

**Determine and Trend GCS**
- Consider Other Protocols
  - Multiple Trauma Protocol (if Not Isolated Head Trauma)
  - Altered Level of Consciousness Protocol
  - Seizure Protocol (if Seizure Activity)

**Isolated Uncomplicated Head Trauma?**
- **Airway Protocol**
  - Do NOT Hyperventilate
- **IV / IO Procedure**
  - Limit IV fluids due to cerebral edema
  - To Maintain MAP > 65 or SBP 90
  - (100 systolic if >70 years old) / Radial Pulses if NIBP Unavailable
  - Do NOT allow patient to become hypotensive

**Evidence of, or Suspect Traumatic Brain Injury (TBI)? GCS ≤ 8**
- **Airway Protocol**
  - Do NOT Allow Patient to Become Hypoxic During ANY Airway Management
  - Maintain SpO₂ > 94% At All Times!
  - Apply Capnography If Advanced Airway Used
  - Ventilate To Maintain CO₂ 35 or 12 Breaths / min
- **IV / IO Procedure**
  - Normal Saline Bolus to Maintain MAP > 80 or SBP 90 / Radial Pulses if NIBP Unavailable
  - Do NOT allow patient to become hypotensive

**Monitor and Reassess**

**Initiate Trauma Alert**

**Transport**
- to appropriate facility
- Contact receiving facility
- Consult Medical Direction where indicated
- Appropriate transfer of care

**Emt Intervention**
**Aemt Intervention**
**Paramedic Intervention**
**Online Medical Control**

### Key Points

- **Exam: Mental Status, HEENT, Heart, Lungs, Abdomen, Extremities, Back, Neuro**
- If GCS < 12 consider air / rapid transport and if GCS < 9 intubation should be anticipated.
- **GCS < 9? Urgent!**
- Do NOT allow patients to become hypoxic, maintain SpO2 > 94%, abandon intubation attempts if this cannot be maintained. Secure airway by other means.
- Increased intracranial pressure (ICP) may cause **hypertension** and bradycardia (Cushing’s Reflex).
- Hypotension usually indicates injury or shock unrelated to the head injury and should be aggressively treated.
- Limit IV fluids unless patient is hypotensive (systolic BP < 90) fluid resuscitate if necessary to maintain BP, Do NOT allow patients to become hypotensive.
- DO NOT attempt to lower the blood pressure in hypertensive head injured patients with medications such as Nitroglycerine (Nitro-Stat).
- Be alert for c-spine injuries with head trauma.
- Continually reassess the patient, including pupils, LOC, and neurological status.
- Any decrease in GCS suggests a TBI surgical emergency, transport to trauma center
- Capnography is critical! Maintain the CO2 ranges indicated in protocol, 1 point of CO2 change = 3% decrease in cerebral perfusion.
- The most important item to monitor, trend, and document is a change in the level of consciousness / GCS.
- Herniation may occur. Signs are:
  - Cushing’s reflex, Bradycardia, hypertension, widening pulse pressure
  - Decreasing level of consciousness progressing towards coma.
  - Dilatation of pupils – may be unilateral or bilateral
  - Decerebrate posturing (extension of arms and legs)
  - Decorticate posturing (flexion arms and legs)
- Concussions are periods of confusion or LOC associated with trauma, which may have resolved by the time EMS arrives. A physician ASAP should evaluate any prolonged confusion or mental status abnormality, which does not return to normal within 15 minutes or any documented loss of consciousness.
- Consider Restraints if necessary for patient's and / or personnel’s protection per the RESTRAINT PROCEDURE.

- Determine type of injury

- **Eye**
  - Remove Contact Lenses (If applicable)
  - If burn or foreign body, determine substance. Flush with copious Amounts of normal saline
  - If penetrating trauma, secure object (Do not remove)
  - Eye Out; Cover with sterile 4 x 4, normal saline and stabilize
  - If Non-Penetrating Trauma or Chemical Burns CONSIDER TOPICAL PAIN CONTROL TETRACAINE (PONTOCaine)
    - 1 - 2 drops to affected eye
  - **WARNING**: If Tetracaine (Pontocaine) is used, patient must be evaluated at hospital

- **Tongue**
  - Have suction on and immediately available to maintain airway
  - Attempt to control bleeding with direct pressure / gauze if able and will not cause airway obstruction

- **Nose**
  - Have suction on and immediately available to maintain airway
  - Sit patient upright and forward. Pinch nostrils. Consider external applied cold pack to bridge of nose

- **Ear**
  - If foreign body, determine substance
  - Attempt to control bleeding with direct pressure / gauze

- **Tooth**
  - If tooth out attempt preservation as soon as possible in: Commercially available tooth preservation kit (if available) or whole milk (if available). Handle by enamel only, do not touch roots

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care
MAXILLOFACIAL / EYE TRAUMA

<table>
<thead>
<tr>
<th>HISTORY</th>
<th>SIGNS AND SYMPTOMS</th>
<th>DIFFERENTIAL DIAGNOSIS</th>
</tr>
</thead>
</table>
| • Trauma of any type that results in injury to one or both eyes. | • Irritation to eye  
• Visual disturbances  
• Obvious penetrating injury  
• Burn (chemical, thermal)  
• Loss of vision  
• Dizziness  
• Loss of consciousness  
• Nausea | • Hypertension  
• Contact lens problem |

KEY POINTS

• If unsure if something can be flushed with water, contact Medical Command.  
• A garden hose can be used to help flush the patient’s eye(s) if available. **DO NOT** use a high-pressure hose or at a high force. If needed, irrigate the patient’s eyes for approximately 5-15 minutes.  
• Begin irrigating immediately, because irreversible damage can occur in a few minutes.

TRAUMA

• Do not allow eye injury to distract you from the basics of trauma care.  
• Do not remove any foreign body imbedded in the eye or orbit. Stabilize any large protruding foreign bodies.  
• With blunt trauma to the eye, if time permits, examine the globe briefly for gross laceration as the lid may be swollen tightly shut later. Sclera rupture may lie beneath an intact conjunctiva.  
• Covering both eyes when only one eye is injured may help to minimize trauma to the injured eye, but in some cases the patient is too anxious to tolerate this.  
• Transport patient supine unless other life threats prohibit this from being done. (This is based on physics, the goal of not letting the fluid within the eye drain out of the eye)

CHEMICAL BURNS

• When possible determine type of chemical involved first. The eye should be irrigated with copious amounts of water or saline, using IV tubing wide open for a minimum of 15 minutes started as soon as possible. Any delay may result in serious damage to the eye.  
• Always obtain name and, if possible, a sample of the contaminant or ask that they be brought to the hospital as soon as possible.

CONTACT LENSES

• If possible, contact lenses should be removed from the eye; be sure to transport them to the hospital with the patient. If the lenses cannot be removed, notify the ED personnel as soon as possible.  
• If the patient is conscious and alert, it is much safer and easier to have the patient remove their lenses.

ACUTE, UNILATERAL VISION LOSS

• When a patient suddenly loses vision in one eye with no pain, there may be a central retinal artery occlusion. Urgent transport and treatment is necessary.  
• Patient should be transported flat.
MULTIPLE TRAUMA

Consider Air transport if delay due to extrication

Abnormal

Reassess Airway
Ventilate Appropriately

NORMAL SALINE BOLUS
To Maintain MAP > 65 or SBP 90 (100 systolic if >70 years old) / Radial Pulses if NIBP Unavailable

If evidence of current / previous uncontrolled hemorrhage, HR > 120 and / or SBP < 90, within 60 mins of injury
Consider TRANEXAMIC ACID (TXA) 1 Gram mixed in 100 ml D5W over 10 mins

Monitor and Reassess

Continued Hypotension?
Trauma Arrest?
Consider NEEDLE DECOMPRESSION

## KEY POINTS

- Exam: Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Back, Neuro
- Mechanism is the most reliable indicator of serious injury.
- In prolonged extrications or serious trauma, consider air transportation for transport times and the ability to give blood.
- Do not overlook the possibility of associated domestic violence or abuse
### History
- Time of injury
- Mechanism: blunt / penetrating
- Loss of consciousness
- Bleeding
- Medications
- Evidence of multi-trauma

### Signs and Symptoms
- Excessive bleeding
- Unresponsive; not breathing
- Cardiac arrest
- Significant mechanism of injury

### Differential Diagnosis
- Obvious DOA
- Death

---

### Key Points
- Immediately transport traumatic cardiac arrest patients.
- Except for airway management, traumatic cardiac arrests are “load and go” situations.
- Resuscitation should not be attempted in trauma arrest patients with:
  1. Spinal transection
  2. Decapitation
  3. Total body burns
  4. Severe blunt trauma that are without vital signs
  5. Without pupillary response
  6. Without an organized or shockable cardiac rhythm at the scene
- Patients in cardiac arrest with deep penetrating cranial injuries and patients with penetrating cranial or truncal wounds associated with asystole and a transport time of more than 15 minutes to a definitive care facility are unlikely to benefit from resuscitative efforts.
- Extensive, time-consuming care of trauma victims in the field is usually not warranted. Unless the patient is trapped, they should be enroute to a medical facility within 10 minutes after arrival of the ambulance on the scene.

### MANAGEMENT OF TRACHEOSTOMY PATIENTS

**Tracheostomies come in 2 types**
- Cuffed tracheostomy – has a distal cuff to create seal in patient trachea. Necessary for patients requiring mechanical ventilation. There is a ET tube like pilot balloon to verify cuff patency once placed in the tracheal stoma. Select devices may be filled with saline rather than air, this is device specific. Nearly all will be filled with air.
- Uncuffed tracheostomy – does not have distal cuff and does not seal in the trachea. This type is used for spontaneously breathing patients who require an alternate airway due to upper airway defect. These patients may be able to speak with the use of special tracheostomies or valves.

**Tracheostomies have 2 essential parts**
- Outer cannula – This is the base that secures in the tracheal stoma. If it is cuffed tracheostomy, the cuff is on this section. There are “wings” that allow for attachment of a tie around the patient’s neck. Some recently placed devices may be sutured in place.
- Inner cannula – is removeable for cleaning / replacement. Usually clips or is locked in with a quarter turn detent.

**Management of tracheostomy patients**
- Have suction equipment on hand throughout all phases of treatment and transport suction to maintain patency as required.
- If a tracheostomy becomes dislodged and cannot be reinserted, use a ET tube sized to the stoma size.
- If a tracheostomy comes out and can be reinserted or needs changed, utilize a bougie (tube changer) if available to insert into stoma and “railroad” the tracheostomy over the bougie into place.
- Check all cuffed tracheostomy cuffs for patency, add additional air if an air leak can be appreciated around stoma.
- If a tracheostomy patient cannot be bagged effectively suspect mucous plug. Alternate trachea lavage with saline, suction, and bagging until resolved.
- If a tracheostomy patient presents with increased work of breathing, remove, and inspect inner cannula.
- Pediatric tracheostomies may not have inner cannulas due to their size.
- Take an extra tracheostomy kit or inner cannula with you during transport if available at pickup location.
- Patients and their care givers are frequently very adept at managing these devices, utilize them as a resource.
- See procedures section for stoma and tracheostomy care procedures.

### KEY POINTS

- **EtCo2 measurement is mandatory with all methods of intubation. Document results of SpO2.**
- **Limit intubation attempts to 2 per patient max.**
- **BVM and oral airway is acceptable means of airway control and ventilation during prehospital care.**
- **If unable to intubate, continue BVM ventilations, transport rapidly, and notify receiving hospital early.**
- **Provide Spinal Motion Restriction for patients with suspected spinal injury.**
- **Do not assume hyperventilation is psychogenic - use oxygen, not a paper bag.**
- **Continuous pulse oximetry should be utilized in all patients with an inadequate respiratory function.**
- **Consider c-collar to help maintain ETT placement for all intubated patients.**
FOREIGN BODY AIRWAY OBSTRUCTION (FBAO)

### Infant (0 – 12 months)

- **Head Tilt / Chin Lift / Jaw Thrust / Airway Manuevers**
  - **Coughing Conscious**
    - **OXYGEN**
      - 10 – 15 L Infant Mask as tolerated
    - **5 Back Blows / 5 Chest thrusts**
  - **Complete Obstruction Conscious**
    - **TRANSPORT** to appropriate facility
      - **CONTACT** receiving facility
      - **CONSULT** Medical Direction where indicated
      - **APPROPRIATE** transfer of care
  - **Complete Obstruction Unconscious**
    - **Visualize**
      - Finger Sweep
        - (Only if visualized / attainable)
    - **Consider use of**
      - Laryngoscope / Magill Forceps
    - **Open airway / ventilate**
      - (May reposition and repeat)
    - **Chest Compressions / CPR**
    - **If unable to ventilate**, repeat / continue sequence

### Child (1 – 8 years)

- **Head Tilt / Chin Lift / Jaw Thrust / Airway Manuevers**
  - **Coughing Conscious**
    - Encourage patient to cough
    - **OXYGEN**
      - 10 – 15 LPM Pediatric Mask as tolerated
  - **Complete Obstruction Conscious**
    - **Abdominal Thrusts**
  - **Complete Obstruction Unconscious**
    - **Visualize**
      - Finger Sweep
        - (Only if visualized / attainable)
    - **Consider use of**
      - Laryngoscope / Magill Forceps
    - **Open airway / ventilate**
      - (May reposition and repeat)
    - **Chest Compressions / CPR**
    - **If unable to ventilate**, repeat / continue sequence

### KEY POINTS

- Infants 0 -12 months DO NOT receive abdominal thrusts. Use chest thrusts.
- NEVER perform blind finger sweeps in infants or children.
- Attempt to clear the airway should only be made if foreign body aspiration is witnessed or very strongly suspected and there is complete airway obstruction.
- Even with a complete airway obstruction, positive-pressure ventilation is often successful.
RESPIRATORY DISTRESS UPPER AIRWAY - CROUP

PEDIATRIC PROTOCOL

Calm Patient
Position Patient in Position of Comfort
Do not Lay Patient Down
Do Not Perform Digital Airway Exam

PULSE OXIMETRY PROCEDURE
CARDIAC MONITOR

These patients present with “Seal Bark Cough” or Stridor. If Patient is wheezing, it is a lower airway etiology and should be treated by the Respiratory Distress Lower Airway Protocol

Mild Distress

• Barking cough  
• Stridor  
• Gagging  
• Drooling  
• Inability to swallow  
• Increased respiratory effort | • Asthma  
• Aspiration  
• Foreign body  
• Infection  
• Pneumonia  
• Epiglottitis  
• Congenital heart disease  
• Medication or toxin  
• Trauma |

KEY POINTS

• Exam: Mental Status, HEENT, Skin, Neck, Heart, Lungs, Abdomen, Extremities, Neuro  
• CONSIDER FOREIGN BODY AIRWAY OBSTRUCTION  
• Do not force a child into a position. They will protect their airway by their body position.  
• The most important component of respiratory distress is airway control.  
• **Croup** typically affects children < 2 years of age. It is viral, possible fever, gradual onset, no drooling is noted.  
• **Epiglottitis** is rare and typically affects children > 2 years of age. Patients will appear very sick. It is bacterial, with fever, rapid onset, possible stridor, patient wants to sit up to keep airway open, and drooling is common. Airway manipulation may worsen the condition. DO NOT attempt invasive procedures on the conscious patient who is suspected to have epiglottis.  
• DO NOT attempt an invasive airway procedure unless the patient is in respiratory arrest.  
• Tracheitis presents in a similar manner to epiglottitis and the patient will also appear very sick.  
• **Stridor**, gagging or choking in the breathing patient with respiratory distress may indicate upper airway obstruction.  
• **Wheezing** in the breathing patient with respiratory distress indicates lower airway disease, which may come from a variety of causes. The patient with severe lower airway disease may have altered LOC, be unable to talk, may have absent or markedly decreased breath sounds and severe retractions with accessory muscle use.  
• If the patient has signs of respiratory failure, begin to assist ventilations with BVM, even when they are breathing.
**Respiratory Distress Lower Airway Protocol**

**Universal Patient Care Protocol**

**Pulse Oximetry Procedure**

**Capnography Procedure**

**Cardiac Monitor**

**Respiratory Failure?**

- If the patient presents with stridor, or a “seal bark cough”, it is an upper airway etiology and should be treated by the Respiratory Distress Upper Airway – Croup Protocol.
- Patients under 2 years with no history of asthma CONSIDER BRONCHIOLITIS. Treat with OXYGEN Bronchodilators ineffective.

**Pediatric Airway Protocol**

**Position to Patient Comfort**

**Mild**

**ALBUTEROL (PROVENTIL)**
Nebulized Unit Dose

### KEY POINTS
- **Exam:** Mental Status, HEENT, Skin, Neck, Heart, Lungs, Abdomen, Extremities, Neuro
- Do not force a child into a position. They will protect their airway by their body position.
- The most important component of respiratory distress is airway control.
- DO NOT attempt an invasive airway procedure unless the patient is in respiratory arrest.
- For some patients in severe respiratory distress, wheezing may not be heard.
- Use Albuterol (Proventil) and Ipratropium (Atrovent) for the known asthmatic in severe respiratory distress.
- Stridor, gagging or choking in the breathing patient with respiratory distress may indicate upper airway obstruction.
- Wheezing in the breathing patient with respiratory distress indicates lower airway disease, which may come from a variety of causes. The patient with severe lower airway disease may have altered LOC, be unable to talk, may have absent or markedly decreased breath sounds and severe retractions with accessory muscle use.
- If the patient has signs of respiratory failure, begin to assist ventilations with BVM, even when they are breathing.
UNIVERSAL PATIENT CARE PROTOCOL
Evidence of Trauma – Blunt or Penetrating
Abnormal breath sounds, inadequate respiratory rate,
unequal symmetry, diminished chest excursion, cyanosis

Identify Treatable Causes

Jaw Thrust Airway Maneuver
Give High Flow Oxygen

Sucking Chest Wound
Apply 3-sided Occlusive Dressing or Commercial Chest Seal

Flail Chest
Assist with Ventilation – Gentle Positive Pressure

Penetrating Object
Immovilize Object
Apply Sterile Saline Dressing

If S&S of Tension Pneumothorax
(No lung sounds on affected side, Hypotension, JVD)
NEEDLE CHEST DECOMPRESSION PROCEDURE

⚠️ Be Prepared to Repeat IF S&S Return

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

KEY POINTS
• These injuries involve the airway and are life-threatening.
• Do not become distracted by non-life-threatening injuries that appear terrible.
• A sucking chest wound is when the thorax is open to the outside. The occlusive dressing may be anything such as petroleum gauze, plastic, or a defibrillator pad. Tape only 3 sides down so that excess intrathoracic pressure can escape, preventing a tension pneumothorax. It may help respiration to place patient on the injured side, allowing unaffected lung to expand easier.
• A flail chest is when there are extensive rib fractures present, causing a loose segment of the chest wall resulting in paradoxical and ineffective air movement. Positive pressure breathing via BVM will help push the segment and the normal chest wall out with inhalation and to move inward together with exhalation, getting them working together again. Do not use too much pressure, as to prevent additional damage or pneumothorax.
• A penetrating object must be immovilized by any means possible. If it is very large, cutting may be possible, with care taken not to move it while making the cut. Place an occlusive & bulky dressing over the entry wound.
• A tension pneumothorax is life threatening, look for HYPOTENSION, unequal breath sounds, JVD, increasing respiratory distress, and decreasing mental status. The pleura must be decompressed with a needle to provide relief. Use the intercostal space between the 2nd and 3rd ribs on the midclavicular line, going in on the top side of the 3rd rib. Alternate site, 5th intercostal space mid axillary or anterior axillary line. Once the catheter is placed, watch closely for reocclusion. Be prepared to repeat decompression if signs of tension pneumothorax return. Use a 18-14-gauge needle, length based on the patient.

# SHOCK

## HISTORY
- Blood loss
- Fluid loss
- Vomiting
- Diarrhea
- Fever
- Infection

## SIGNS AND SYMPTOMS
- Restlessness, confusion, weakness
- Dizziness
- Increased HR, rapid pulse
- Decreased BP
- Pale, cool, clammy skin
- Delayed capillary refill

## DIFFERENTIAL DIAGNOSIS
- Trauma
- Infection
- Dehydration
- Vomiting
- Diarrhea
- Fever
- Congenital heart disease
- Medication or toxin

### ALLERGIC REACTION / ANAPHYLAXIS

## HISTORY
- Onset and location
- Insect sting or bite
- Food allergy / exposure
- Medication allergy / exposure
- New clothing, soap, detergent
- History of reactions
- Past medical history
- Medication history

## SIGNS AND SYMPTOMS
- Warm burning feeling
- Itching
- Rhinorrhea
- Hoarseness
- Stridor
- Wheezing
- Respiratory distress
- Altered LOC / coma
- Cyanosis
- Pulmonary edema
- Facial / airway edema
- Urticaria / hives
- Dyspnea

## DIFFERENTIAL DIAGNOSIS
- Urticaria (rash only)
- Anaphylaxis (systemic effect)
- Shock (vascular effect)
- Angioedema (drug induced)
- Aspiration / airway obstruction
- Vasovagal event
- Asthma

---

**Do Not Confuse Epinephrine 1 mg / ml (1:1000) and 0.1 mg / ml (1:10,000)**

Fluid Resuscitate to systolic of 70 + 2 x age

---

## KEY POINTS
- **Exam:** Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Back, Neuro
- Consider all possible causes of shock and treat per appropriate protocol.
- Decreasing heart rate is a sign of impending collapse.
- Most maternal medications pass through breast milk to the infant. Examples: Narcotics, Benzodiazepines.
- Be sure to use the appropriately sized BP cuff.
- Findings in the primary assessment should alert you that the patient is in shock. Pay attention to the patient’s mental status, tachycardia, skin color, and capillary refill.
- Shock is not only caused by blood loss. The provider must evaluate for fluid loss from other causes such as excessive vomiting and / or diarrhea, heat exposure and malnutrition.
- Do not use only the patient’s blood pressure in evaluating shock; also look for lower body temperature, poor capillary refill, decreased LOC, increased heart rate and / or poor skin color or turgor.
- Routinely reassess the patient and provide supportive care.

**Addisonian Crisis / Adrenal Crisis**
- Not a field diagnosis. Patient / family / historian should be aware of diagnosis. They are coached to make sure the patient gets IV steroids emergently. May have their own prescribed injectable steroids for EMS to administer. Check for medical alert tags / bracelet.
- Presents with Dehydration and/or severe vomiting and diarrhea stabbing pain in the abdomen, low back, or legs, low blood pressure (shock), low blood sugar, loss of consciousness.
- Emergent steroid administration in addition to other standard resuscitation techniques. (ex. BGL correction and fluid resuscitation). Use patient supplied steroids before EMS supplied if available.
ANAPHYLACTIC REACTION / SHOCK

**Mild**
- Rash, itching,
  - No difficulty breathing or throat tightening,
  - B/P – normal limits

- **Consider** - If history of severe reaction
  - **EPINEPhrine AUTO-INJECTOR** if available
    - 15 - 30 kg (33 - 66 lbs)
    - AUTO-INJECTOR JR (0.15 mg dose)
    - > 30 kg (66 lbs)
    - AUTO-INJECTOR (0.3 mg dose)

- **diphenhydrAMINE (BENADRYL)**
  - 1 mg / kg
  - slow IV / IM / IO
  - Max Dose 50 mg

- **Never Given IV**

**Moderate / Severe**
- **Radial Pulses Present**
  - Rash, itching,
  - Airway compromise,
  - Wheezing, Swelling,
  - GI Symptoms

- **Hypotension**

- **EPINEPhrine AUTO-INJECTOR** if available
  - 15 - 30 kg (33 - 66 lbs)
  - AUTO-INJECTOR JR (0.15 mg dose)
  - > 30 kg (66 lbs)
  - AUTO-INJECTOR (0.3 mg dose)

- **Concentration**
  - 0.01 mg / kg IM
  - Max Dose 0.5 mg

- **diphenhydrAMINE (BENADRYL)**
  - 1 mg / kg
  - slow IV / IM / IO
  - Max Dose 50 mg

- **DUONEB (ALBUTEROL / IPRATROPIUM)**

- **EMT use only with ONLINE Medical Control**

- **IV NORMAL SALINE BOLUS**
  - 10 - 20 ml / kg
  - May Repeat up to 3 times as required

- **Consider repeat EPINEPhrine (ADRENALINE) after 5 min. if no improvement**

- **methylPREDNISolone (SOLU-MEDROL)**
  - 2 mg / kg
  - Max Dose 125 mg

**DO NOT CONFUSE EPINEPhrine**

- **Concentration**
  - 0.01 mg / ml (1000 mcg / ml)
  - 1:1000

**DIAGRAM**

**UNIVERSAL PATIENT CARE PROTOCOL**

**OXYGEN**

**CAPNOGRAPHY PROCEDURE**

**IV / IO PROCEDURE**

- Apply Cardiac Monitor and Assess Vitals

- **IMPENDING ARREST**
  - Anaphylactic Shock

- **NO Radial Pulses**
  - Severe Hypotension
  - Any AGE
  - Decreased LOC
  - Airway compromise

- **Secure Airway and Ventilate**

- **EPINEPhrine (ADRENALINE)**
  - 0.01 mg / kg IV / IO
  - 0.1 mg / ml (100 mcg / ml)
  - Concentration
  - Max Dose 0.5 mg

- **If ONLY AEMT Available**
  - EPINEPhrine (ADRENALINE)
    - 1 mg / ml (1:1000) Concentration
    - 0.01 mg / kg IM
    - Max Dose 0.5 mg

- **If ONLY EMT Available**
  - **EPINEPhrine AUTO-INJECTOR** if available
    - 15 - 30 kg (33 - 66 lbs)
    - AUTO-INJECTOR JR (0.15 mg dose)
    - > 30 kg (66 lbs)
    - AUTO-INJECTOR (0.3 mg dose)

- **IV NORMAL SALINE BOLUS**
  - 10 - 20 ml / kg
  - May Repeat up to 3 times as required

- **methylPREDNISolone (SOLU-MEDROL)**
  - 2 mg / kg
  - Max Dose 125 mg

**MAP Calculation**

2 X Diastolic Blood Pressure + Systolic Blood Pressure / 3 = MAP

**Push Dose EPINEPHrine (Adrenaline) Preparation**

Mix 1 mg EPINEPHrine (Adrenaline) of 1mg / ml (1:1000) in 100 ml of D5 or Normal Saline

*This makes 10 mcg / ml concentration*

Shake bag well to mix

Draw from bag and administer
SECTION 9 - PEDIATRIC CARDIAC

Pediatric Asystole / Pulseless Electrical Activity (PEA) ............................................................ 2-9
Pediatric Bradycardia .................................................................................................................. 4-9
Pediatric Narrow Complex Tachycardia (SVT) ......................................................................... 6-9
Pediatric Post Resuscitation Care ............................................................................................. 8-9
Pediatric Post Resuscitation Care (Targeted Temperature Management (TTM)) .................. 9-9
Pediatric Ventricular Fibrillation (V-FIB) and Pulseless Ventricular Tachycardia ............. 10-9
Pediatric Wide Complex Tachycardia ....................................................................................... 12-9
**ASYSTOLE / PULSELESS ELECTRICAL ACTIVITY (PEA)**

**UNIVERSAL PATIENT CARE PROTOCOL**
- Continuous CPR

**PEDIATRIC AIRWAY PROTOCOL**
- Apply Cardiac Monitor
- Confirm Asystole / PEA

**CAPNOGRAPHY PROCEDURE**
- Identify Possible Causes:
  - Hypoxemia
  - Acidosis
  - Hypovolemia
  - Tension
  - Pneumothorax
  - Hypothermia

**IV / IO PROCEDURE**
- EPINEPHrine (ADRENALINE)
  - 0.01 mg / kg IV / IO of
  - 0.1 mg / ml (1:10,000) Solution
  - Repeat every 3 - 5 minutes
  - Max 1 mg per dose
- Double Check EPI Concentration

**NORMAL SALINE IV BOLUS**
- 20 ml / kg
- Repeat as needed

**BLOOD GLUCOSE PROCEDURE**
- Glucose < 60
  - DEXTROSE 10%
  - 5 ml / kg IV / IO
  - If DEXTROSE 10% is unavailable, see medication section for DEXTROSE 25% or 50%

**TRANSPORT** to appropriate facility
- **CONTACT** receiving facility
- **CONSULT** Medical Direction where indicated
- **APPROPRIATE** transfer of care

**AT ANY TIME**
- Return of Spontaneous Circulation (ROSC)

**GO TO PEDIATRIC POST RESUSCITATION CARDIAC CARE PROTOCOL**

**Do Not Confuse EPINEPhrine 1 mg / ml (1:1000) and 0.1 mg / ml (1:10,000)**

If Dextrose 25% Not Available, Waste 25 ml of Dextrose 50% and replace with 25 ml of normal saline

Fluid Resuscitate to systolic of 70 + 2 x age

### KEY POINTS

- **Exam: Mental Status**
- Always confirm asystole in more than one lead.
- Cardiac arrest in children is primarily due to lack of an adequate airway, resulting in hypoxia.
- If the patient converts to another rhythm or has a return of circulation, refer to the appropriate protocol and treat accordingly.
- When assessing for a pulse, palpate the brachial or femoral arteries for infants and the carotid or femoral artery for children.
- Continue BLS procedures throughout the resuscitation.
- If the patient is intubated, be sure to routinely reassess tube placement.
- If the patient has an IO, routinely reassess for patency.
- Consider atropine when evidence of increase vagal stimulation is present.

Do Not Confuse EPINEPhrine 1 mg / ml (1:1000) and 0.1 mg / ml (1:10,000)

## KEY POINTS

- Exam: Mental Status, HEENT, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro
- Heart Rate < 100 (Neonates)
- Heart Rate < 80 (Infants)
- Heart Rate < 60 (Children > 2 years)
- Infant = < 1 year of age
- Most maternal medications pass through breast milk to the infant.
- Most pediatric arrests are due to airway problems.
- Hypoglycemia, severe dehydration and narcotic effects may produce bradycardia.
- Pediatric patients requiring external transcutaneous pacing require the use of pads appropriate for pediatric patients per the manufacturers’ guidelines.
- Identify and treat possible causes for pediatric bradycardia:
  1. Hypoxia
  2. Hypothermia
  3. Head injury
  4. Heart block
  5. Toxic ingestion / exposure
- Refer to pediatric reference material when unsure about patient weight, age and / or drug dosage.
- The minimum dose of Atropine that should be administered to a pediatric patient is 0.1 mg.
- If the rhythm changes, follow the appropriate protocol.
- Be sure of all medication doses, look it up in reference material.
NARROW – COMPLEX TACHYCARDIA

**UNIVERSAL PATIENT CARE PROTOCOL**

Cardiac Monitor
Attempt to Identify Cause

**CAPNOGRAPHY PROCEDURE**

**IV / IO PROCEDURE**

If rhythm changes, Go to Appropriate Protocol

- **Stable (Signs of Perfusion)**
  - HR > 220 infant / HR > 180 child

  May attempt Vagal Maneuvers

  - **ADENOSINE (ADENOCARD)**
    - 0.1 mg / kg IV / IO Rapid - Followed with flush
    - Max dose 6 mg
    - Upper extremity venous access

  No response
  - 1 – 2 minutes

  - **ADENOSINE (ADENOCARD)**
    - 0.2 mg / kg IV Rapid - Followed with flush
    - Max dose 12 mg

  IV Normal Saline Bolus 10 - 20 ml / kg
  If signs dehydration or hypoperfusion
  Repeat as needed

- **Unstable (Signs of Hypoperfusion)**
  - HR > 220 infant / HR > 180 child

  May go directly to Cardioversion
  May Administer ADENOSINE (ADENOCARD)
  If vascular access already in place

  Consider Sedation
  - MIDAZOLAM (VERSED) 0.1 mg / kg IV / IO
  - Max Dose 2.5 mg IV / IO
  - MIDAZOLAM (VERSED) 0.2 mg / kg IN
  - Max Dose 5 mg IN
  OR
  - LORazepam (ATIVAN) 0.05 mg / kg slow IV / IO / IN
  - Max Dose 2 mg

  SYNCHRONIZED CARDIOVERSION
  (0.5 – 1 J / kg)

  No response
  - 1 – 2 minutes

  Repeat SYNCHRONIZED CARDIOVERSION as Needed
  (1 – 2 J / kg)

  IV Normal Saline Bolus 10 - 20 ml / kg
  If signs dehydration or hypoperfusion
  Repeat as needed

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care
NARROW – COMPLEX TACHYCARDIA

### HISTORY
- Past medical history
- Medications or toxic ingestion (Aminophylline, diet pills, thyroid supplements, decongestants, digoxin)
- Drugs (nicotine, cocaine)
- Congenital heart disease
- Respiratory distress
- Syncope or near syncope

### SIGNS AND SYMPTOMS
- HR: Child > 180/bpm
- Infant > 220/bpm
- Pale or cyanosis
- Diaphoresis
- Tachypnea
- Vomiting
- Hypotension
- Altered level of consciousness
- Pulmonary congestion
- Syncope

### DIFFERENTIAL DIAGNOSIS
- Heart disease (congenital)
- Hypo / hyperthermia
- Hypovolemia or anemia
- Electrolyte imbalance
- Anxiety / pain / emotional stress
- Fever / infection / sepsis
- Hypoxia
- Hypoglycemia
- Medication / toxin / drugs (see HX)
- Pulmonary embolus
- Trauma
- Tension pneumothorax

**Fluid Resuscitate to systolic of 70 + 2 x age**

### KEY POINTS
- **Exam:** Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Carefully evaluate the rhythm to distinguish Sinus Tachycardia, Supraventricular Tachycardia, and Ventricular Tachycardia
- Separating the child from the caregiver may worsen the child’s clinical condition.
- Pediatric pads should be used in children < 10 kg.
- Monitor for respiratory depression and hypotension associated if LORazepam (ATIVAN) or MIDAZOLAM (VERSED) is used.
- Continuous pulse oximetry is required for all SVT Patients if available.
- Document all rhythm changes with monitor strips and obtain monitor strips with each therapeutic intervention.
- Possible causes of tachycardia; hypoxia, hypovolemia, fear, and pain.
- A complete medical history must be obtained.
- Do not delay cardioversion to gain vascular access for the unstable patient.
- If you are unable to get the monitor to select a low enough joule setting, contact Online Medical Control.
- If the patient is stable, do not cardiovert.
- Record 3-Lead EKG strips during adenosine administration.
- Perform a 12-Lead EKG prior to and after Adenosine (Adenocard) conversion or cardioversion of SVT.
- If the rhythm changes, follow the appropriate protocol.
**UNIVERSAL PATIENT CARE PROTOCOL**

- Continue Ventilatory Support with 100% OXYGEN
- CAPNOGRAPHY PROCEDURE
- IV / IO PROCEDURE
- 12 LEAD EKG PROCEDURE

**Vital Signs**

- Bradycardia
- Hypotension
- Electrical Conversion (NO anti-arrhythmic already given during resuscitation)
- Anti-Arrhythmic Conversion with Continued Ventricular Ectopy

**If arrest reoccurs, revert to appropriate protocol and/or initial successful treatment**

**Transport** to appropriate PEDIATRIC facility **Contact** receiving facility **Consult** Medical Direction where indicated **Appropriate** transfer of care

RECEIVING HOSPITAL MUST BE ABLE TO CONTINUE COOLING!
Use of this protocol is dependent on the ability of the receiving hospital to continue the cooling. Do not begin cooling if the receiving hospital is unable to continue cooling.

Use this protocol in conjunction with standard post resuscitation care. Maintain BP and heart rhythm with treatments in the POST RESUSCITATION CARDIAC CARE protocol. If patient loses pulses / re-arrests discontinue cooling and treat per appropriate arrest protocol.

Place advanced airway or treat by POST RESUSCITATION CARDIAC CARE protocol only if unable to place advanced airway

Do not delay transport to begin TTM protocol

COMATOSE PATIENT WITH A RETURN OF SPONTANOUS CIRCULATION (ROSC)

Advanced airway in Place?
Intubated, or Extraglottic (BIAD) Airway
Capnography Procedure
Maintain CO₂ 35 - 45

⚠️ Do not cool patient who arrested from trauma, hypovolemia, preexisting hypothermia, or is pregnant.

Apply Cooling Collar or Apply Cold Packs
Neck, Bilateral Axilla, Bilateral Groin

Is patient shivering?

TRANSPORT
Transport to facility with TTM resuscitation protocol

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care

MIDAZOLAM (VERSED) 0.1 mg / kg IV / IO
Max Dose 2.5 mg IV / IO
MIDAZOLAM (VERSED) 0.2 mg / kg IN
Max Dose 5 mg IN
OR
LORazepam (ATIVAN) 0.05 mg / kg slow IV / IO / IN
Max Dose 2 mg

⚠️ If Midazolam (Versed) or LORazepam (Ativan) Unavailable,
See Medication Section for Diazepam (Valium)

---

**KEY POINTS**

- **Exam:** Mental Status
- Monophasic and Biphasic waveform defibrillators should use the same energy levels noted.
- In order to be successful in pediatric arrests, a cause must be identified and corrected.
- Airway is the most important intervention. This should be accomplished immediately. Patient survival is often dependent on airway management success.
- If the patient converts to another rhythm, follow the appropriate protocol and treat accordingly.
- If the patient converts back to ventricular fibrillation or pulseless ventricular tachycardia, defibrillate at the previously used setting.
- Defibrillation is the definitive therapy for ventricular fibrillation and pulseless ventricular tachycardia.
- Defibrillate 30 - 60 seconds after each medication administration.
- The proper administration sequence is CPR (continuous), shock, drug, shock, drug.

**UNIVERSAL PATIENT CARE PROTOCOL**

Cardiac Monitor
Attempt to Identify Cause

**CAPNOGRAPHY PROCEDURE**

**IV / IO PROCEDURE**

If rhythm changes, Go to Appropriate Protocol

### Stable (Signs of Perfusion)

- HR > 220 infant / HR > 180 child

May attempt Vagal Maneuvers

**AMIODARONE (CORDARONE)**

- 5 mg / kg IV / IO
- Mix in 100 ml D5 - Over 20 – 60 min
- Max dose 150 mg

⚠️ If Amiodarone (Cordarone) Unavailable, See Medication Section for Lidocaine (Xylocaine)

No response

1 – 2 minutes

IV Normal Saline Bolus 20 ml / kg

If signs dehydration / hypoperfusion
May Repeat up to 3 times as required

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

### Unstable (Signs of Hypoperfusion)

- HR > 220 infant / HR > 180 child

May go directly to Synchronized CARDIOVERSION

Consider Sedation

- MIDAZOLAM (VERSED) 0.1 mg / kg IV / IO
- Max Dose 2.5 mg IV / IO
- MIDAZOLAM (VERSED) 0.2 mg / kg IN
- Max Dose 5 mg IN
- OR
- LORazepam (ATIVAN) 0.05 mg / kg slow IV / IO / IN
- Max Dose 2 mg

⚠️ If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for DiazePAM (Valium)

Capnography Required

SYNCHRONIZED CARDIOVERSION

(0.5 – 1 J / kg)

No response

1 – 2 minutes

Repeat SYNCHRONIZED CARDIOVERSION as Needed

(1 – 2 J / kg)

IV Normal Saline Bolus 20 ml / kg

If signs dehydration / hypoperfusion
May Repeat up to 3 times as required

**Fluid Resuscitate to systolic of 70 + 2 x age**

**Key Points**

- **Exam:** Mental Status, Skin, Neck, Lung, Heart, Abdomen, Back, Extremities, Neuro
- Carefully evaluate the rhythm to distinguish Sinus Tachycardia, Supraventricular Tachycardia, and Ventricular Tachycardia
- Separating the child from the caregiver may worsen the child’s clinical condition.
- Pediatric paddles should be used in children < 10 kg.
- Monitor for respiratory depression and hypotension associated if LORazepam (ATIVAN) or MIDAZOLAM (VERSED) is used.
- Continuous pulse oximetry is required for all SVT Patients if available.
- Document all rhythm changes with monitor strips and obtain monitor strips with each therapeutic intervention.
- Possible causes of tachycardia; hypoxia, hypovolemia, fear, and pain.
- A complete medical history must be obtained.
- Do not delay cardioversion to gain vascular access for the unstable patient.
- If you are unable to get the monitor to select a low enough joule setting, contact Online Medical Control.
- If the patient is stable, do not cardiovert.
- Record 3-Lead EKG strips during adenosine administration.
- Perform a 12-Lead EKG prior to and after medication conversion or cardioversion of SVT.
- If the rhythm changes, follow the appropriate protocol.

KEY POINTS

- Exam: Mental Status, HEENT, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro
- Be aware of AMS as potential sign of an environmental toxin or Haz-Mat exposure and protect personal safety.
- It is safer to assume hypoglycemia than hyperglycemia if doubt exists.
- Do not let alcohol confuse the clinical picture. Low glucose (< 60), normal glucose (60 - 120), high glucose (> 250).
- Consider restraints if necessary for patient's and / or personnel's protection per the restraint procedure.
- Protect the patient airway and support ABCs.
- Document the patient’s Glasgow coma score pre and post treatment.
- Signs and symptoms of narcotic overdose include respiratory depression and altered mental status.
- Naloxone (Narcan) administration may cause the patient to go into acute opiate withdrawal, which includes vomiting, agitation, and / or combative behavior. Always be prepared for combative behavior. Naloxone (Narcan) may wear off in as little as 20 minutes causing the patient to become more sedate and possibly hypo ventilate. All A&O 4 patients having received Naloxone (Narcan) should be transported. If patient refuses transport, contact Online Medical Control before release.

ONLY A FEW CAUSES CAN BE TREATED IN THE FIELD. CARE SHOULD FOCUS ON MAINTAINING AIRWAY AND RAPID TRANSPORT
# Universal Patient Care Protocol

## Administer Oxygen

## IV Procedure

### Patient has Nausea / Vomiting

**Ondansetron (Zofran)**
- 0.15 mg / kg IM or IV over 2 - 4 minutes > 1 Year
- or - 0.15 mg / kg Injectable Liquid PO > 1 Year
  - Max 4 mg

**Ondansetron (Zofran)**
- Oral Dissolving Tabs
  - 4 mg Oral > 40 kg AND 12 years
  - Max 4 mg

**Transport** to appropriate facility
**Contact** receiving facility
**Consult** Medical Direction where indicated
**Appropriate** transfer of care

## ANTI-EMETIC PROTOCOL

### HISTORY
- Nausea
- Vomiting
- Medication(s) administration such as narcotic analgesics

### SIGNS AND SYMPTOMS
- Complaints of nausea and/or vomiting

### DIFFERENTIAL DIAGNOSIS
- Consider AMI / 12 lead EKG
- Gastroenteritis
- Toxic ingestion / food poisoning
- Bowel obstruction
- Appendicitis
- Gastritis
- Cholecystitis (gallbladder)
- Hepatitis/ cirrhosis
- Headaches / migraine
- Pregnancy
- Hypertensive crisis
- Electrolyte imbalances
- DKA
- Intracranial pressure
- Sepsis / infections

### KEY POINTS
- Position patient to protect airway as appropriate. (Recovery position, sitting up, etc.)
- Immediately position entire patient or their head to side if patient begins vomiting then retrieve suction.
- Patients with altered LOC and nausea/vomiting need to have airway maintenance prioritized before medication.
- Prepare and test suction prior to its need.
- Give Ondansetron (Zofran) over at least 2 minutes, slow IV. Follow up with second dose in if symptoms unresolved.
- Treat patients early, no need to wait for patient to begin vomiting to administer Ondansetron (Zofran).
- Patients receiving medications such as narcotic analgesics may require concurrent administration of Ondansetron (Zofran) to reduce nausea associated with such medications.
For Use in Psychosis Only
NOT For Medical Emergencies Such as Hypoxemia, Sepsis, Seizure, Encephalitis, Hypoglycemia, or Stroke

If patient is Hyperthermic begin cooling with ice packs in groin and axilla.

Agitation – Not Combative

diphenhydrAMINE (BENADRYL)
1 mg / kg
slow IV / IM / IO
Max Dose 50 mg

⚠️ If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)

CAPNOGRAPHY PROCEDURE Required

SCENE SAFETY
SUMMON LAW ENFORCEMENT

UNIVERSAL PATIENT CARE PROTOCOL

Remove patient from Stressful environment

Verbal techniques (Reassurance, calm, establish rapport)

Treat Suspected Problems per Appropriate Protocol
AMS - Overdose - Head Trauma - Hypoglycemia

COMBATIVE

SCENARIO

Violent under 16 years
Risk to Self or others

RESTRAINT PROCEDURE

MIDAZOLAM (VERSED)
0.1 mg / kg IV / IO
Max Dose 2.5 mg
or
0.2 mg / kg IM / IN
Max Dose 5 mg
or
LORazepam (ATIVAN) 0.05 – 0.1 mg / kg slow IV / IO / IN / IM
Max Dose 2 mg

⚠️ If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)

CAPNOGRAPHY PROCEDURE Required

Combative – not Violent

Combative - Violent

Significant Threat to Providers
16 years and above, and over 50 kg

RESTRAINT PROCEDURE

KETAMINE (KETALAR)
2 mg / kg IM
USE 100 mg / ml Concentration
May Repeat 1 mg / kg IM in 5 Min if NO RESPONSE
Max per dose 250 mg

If Signs of Emergence
After KETAMINE Administer
MIDAZOLAM (VERSED)
0.1 mg / kg IV / IO
Max Dose 2.5 mg
or
0.2 mg / kg IM / IN
Max Dose 5 mg
or
LORazepam (ATIVAN) 0.05 – 0.1 mg / kg slow IV / IO / IN / IM Max Dose 2 mg

⚠️ If Midazolam (Versed) or LORazepam (Ativan) Unavailable, See Medication Section for diazePAM (Valium)

⚠️ Notify receiving Physician Ketamine (Ketalar) administered so patient presentation is not misconstrued as other etiology

CAPNOGRAPHY PROCEDURE Required

Constant reassessment of ABC’s, personal, and patient safety

TRANSPORT to appropriate facility CONTACT receiving facility CONSULT Medical Direction where indicated APPROPRIATE transfer of care

EMT Intervention | AEMT Intervention | PARAMEDIC Intervention | Online Medical Control
BEHAVIORAL / PSYCHIATRIC EMERGENCIES

ALL RESPONDERS SHOULD HAVE A HEIGHTENED AWARENESS OF SCENE SAFETY

<table>
<thead>
<tr>
<th>HISTORY</th>
<th>SIGNS AND SYMPTOMS</th>
<th>DIFFERENTIAL DIAGNOSIS</th>
</tr>
</thead>
</table>
|  Situational crisis  
   Psychiatric illness / medications

  differential diagnosis  
   Alcohol intoxication  
   Toxin / substance abuse  
   Medication effect / OD  
   Withdrawal syndromes  
   Depression  
   Bipolar (manic-depressive)  
   Schizophrenia  
   Anxiety disorders |

**Agitated – Non-Combative**  
Patient is experiencing a period of high anxiety seemingly from a psychiatric event not otherwise treatable by EMS who is not a treat to self or others

**Combative – Not Violent**  
Patient is a treat to self or others and can be controlled and restrained with appropriate help without significant risk to the providers

**Combative – Violent**  
Patient is in a violent state that puts providers at significant risk despite appropriate help

Criteria for Restraint Use:
- Patient out of control and may cause harm to self or others.
- Necessary force required for patient control without causing harm.
- **Position of patient must not impede airway or breathing.**
- Restraints must not impede circulation.
- Place mask on patient for body secretion protection. May use TB mask, or Non-rebreather if patient needs oxygen.
- Use supine or lateral positioning ONLY.
- MSP checks are required every 15 min.
- DOCUMENT methods used.

Criteria for medication use for anxiolysis / combative patients:
- Patient out of control and may cause harm to self or others.
- Patient is NOT a medical patient (treat underlying causes).
- Patient is an ADULT patient.
- Ketamine (Ketalar) or Haloperidol (Haldol) can be given safely without harm to patient or EMS.
- Use necessary force required for patient control without causing harm.
- **Position of patient must not impede airway or breathing.**
- DOCUMENT methods used.

**Emergence Symptoms**
- Confusion  
  Excitement  
  Irrational Behavior  
  Hallucinations

**Extrapyramidal Symptoms (EPS)**
- Involuntary Movements  
  Purposeless Movements  
  Tongue Protrusion - Rapid Eye Blinking  
  Facial Grimacing - Lip Smacking / Puckering

**Neuroleptic Malignant Syndrome**
- Increased Body Temp > 38C (100.4F)  
  Muscle Rigidity  
  Diaphoresis  
  Altered LOC

**KEY POINTS**
- Exam: Mental Status, Skin, Heart, Lungs, Neuro
- All psychiatric patients must have medical clearance at a hospital ED before transport to a mental health facility.
- Your safety first!!
- Be sure to consider all possible medical / trauma causes for behavior. (Hypoglycemia, overdose, substance abuse, hypoxia, head injury, seizure, etc.)
- Do not irritate the patient with a prolonged exam.
- Do not overlook the possibility of associated domestic violence or child abuse.
- The safety of on scene personnel is the priority. Protect yourself and others by summoning law enforcement to assure everyone’s safety and if necessary, to enable you to render care. Do not approach the patient if he / she is armed with a weapon.
- Consider the medical causes of acute psychosis. Causes may include head trauma, hypoglycemia, acute intoxication, sepsis, CNS insult and hypoxia.
- Suicide ideation or attempts must be transported for evaluation.
- Be alert for rapidly changing behaviors.
- Limit patient stimulation and use de-escalation techniques.
- If the patient has been placed in handcuffs by a law enforcement agency, then a member from that agency MUST ride with the patient in the ambulance to the hospital.
- Consider treatment of agitation / anxiety combative ness for patients requiring restraint procedure.
- Ketamine use in pregnancy is a risk / benefit assessment per case. Consult Medical Direction if there are questions.
**Universal Patient Care Protocol**

**Blood Glucose Procedure**

- **Glucose < 60**
  - **Oral Glucose**
    - 5 - 10 g (1/2 Tube)
    - (If alert with no IV access and no airway compromise)
  - **Or**
    - Dextrose 10%
    - 5 ml / kg IV / IO
  - **If Dextrose 10% is unavailable, see medication section for Dextrose 25% or 50%**
  - **If no IV / IO Access**
    - Glucagon (Glucagen)
    - 0.5 if < 20 kg
    - 1 mg if > 20 kg
    - IM
    - Maximum 1 mg
    - May repeat if no change

- **Glucose > 250**
  - Check for Hypotension, Tachycardia, Poor Cap Refill
  - NORMAL SALINE
    - 20 ml / kg Bolus
    - Over 60 minutes
    - IF SIGNS OF DEHYDRATION

- **Recheck Blood Glucose**

- **Transport** to appropriate facility
  - **Contact** receiving facility
  - **Consult** Medical Direction where indicated
  - **Appropriate** transfer of care

Fluid Resuscitate to systolic of 70 + 2 x age

KEY POINTS

Hyperglycemia:
- Diabetic Ketoacidosis (DKA) is a complication of diabetes mellitus. It can occur when insulin levels become inadequate to meet the metabolic demands of the body for a prolonged amount of time (onset can be within 12 - 24 hours). Without enough insulin the blood glucose increases, and cellular glucose depletes. The body removes excess blood glucose by dumping it into the urine. Pediatric patients in DKA should be treated as hyperglycemic under the Pediatric Diabetic Emergencies Protocol.
- Patients can have Hyperglycemia without having DKA.

Hypoglycemia:
- Always suspect Hypoglycemia in patients with an altered mental status.
- If a blood glucose analysis is not available, a patient with altered mental status and signs and symptoms consistent with hypoglycemia should receive Dextrose, or Glucagon (Glucagen).
  o Dextrose is used to elevate BGL but it will not maintain it. The patient will need to follow up with a meal, if not transported to a hospital.
- If the patient is alert and can swallow; consider administering oral glucose, have patient drink orange juice with sugar or a sugar containing beverage, or have the patient eat a candy bar or meal.
- Check the patient’s BGL after the administration of Dextrose, Glucagon (Glucagen), or after any attempt to raise the patient’s BGL.

Miscellaneous:
- If IV access is successful after Glucagon (Glucagen) IM and the patient is still symptomatic, Dextrose should be administered.
## Universal Patient Care Protocol

1. **Document Patient Temperature**
2. **Remove Patient from Heat Source**
3. **Remove Patient Clothing**
4. **Increase Air Flow Around Patient**

### Cardiac Monitor

**Capnography Procedure**

### IV / IO Procedure

- **Fever:** Normal Saline 10 - 20 ml / kg Bolus
- **Heat Exhaustion:** Normal Saline 10-20 ml / kg Bolus
- **Heat Stroke:** Normal Saline TKO

### If Heat Stroke

- **Attempt Cooling Before Transport** but don’t delay
- Coldest water available or ICE water if possible
- **Apply Ice Packs** to Patient (Groin, Axilla, and Posterior neck)

### Monitor and Reassess

**Appropriate Protocol Based on Patient Symptoms**

### Transport to Appropriate Facility

- **Contact** receiving facility
- **Consult** Medical Direction where indicated
- **Appropriate** transfer of care

# HYPERTHERMIA / HEAT EXPOSURE

## HISTORY
- Age
- Exposure to increased temperatures and humidity
- Past medical history / medications
- Extreme exertion
- Time and length of exposure
- Poor PO intake
- Fatigue and / or muscle cramping

## SIGNS AND SYMPTOMS
- Altered mental status or unconsciousness
- Hot, dry or sweaty skin
- Hypotension or shock
- Seizures
- Nausea

## DIFFERENTIAL DIAGNOSIS
- Fever (infection)
- Dehydration
- Medications
- Hyperthyroidism (storm)
- Delirium tremens (DT’s)
- Heat cramps
- Heat exhaustion
- Heat stroke
- CNS lesions or tumors

<table>

**Fluid Resuscitate to systolic of 70 + 2 x age**

## KEY POINTS
- **Exam:** Mental Status, Skin, HEENT, Heart, Lungs, Neuro
- Extremes of age are more prone to heat emergencies (i.e. young and old).
- Predisposed by use of: tricyclic antidepressants, phenothiazines, anticholinergic medications, and alcohol.
- Cocaine, Amphetamines, and Salicylates may elevate body temperatures.
- Sweating generally disappears as body temperature rises above 104° F (40° C).
- Intensive shivering may occur as patient is cooled.
- **Heat Cramps** consists of benign muscle cramping secondary to dehydration and is not associated with an elevated temperature.
- **Heat Exhaustion** consists of dehydration, salt depletion, dizziness, fever, mental status changes, headache, cramping, nausea and vomiting. Vital signs usually consist of tachycardia, hypotension, and an elevated temperature.
- **Heat Stroke** consists of dehydration, tachycardia, hypotension, temperature > 104° F (40° C), and altered mental status.
- Patients at risk for heat emergencies include neonates, infants, geriatric patients, and patients with mental illness. Other contributory factors may include heart medications, diuretics, cold medications and / or psychiatric medications.
- Heat exposure can occur either due to increased environmental temperatures or prolonged exercise or a combination of both. Environments with temperature > 90° F and humidity > 60% present the most risk.
- Heat stroke occurs when the cooling mechanism of the body (sweating) ceases due to temperature overload and / or electrolyte imbalances. Be alert for cardiac dysrhythmias for the patient with heat stroke.
- In patients with significant hyperthermia (temp > 104° F) begin actively cooling with natural or chemical ice packs applied to the patients’ groin, armpits (axilla), and back of neck.
- Cool patient prior to transport if heat stroke. Coolest water or ice if available.
- Use best cooling options available prior to transport, when feasible cool patient before transport.
- Getting patient wet is most effective, do not delay transport to set up immersion tank, use if already available.
HYPOTHERMIA / FROSTBITE

**UNIVERSAL PATIENT CARE PROTOCOL**

- Remove wet clothing
- Evidence or decreased core temperature?
- Handle patient gently
- Apply hot packs indirectly to skin and / or blankets and turn up vehicle heat

**CAPNOGRAPHY PROCEDURE**

**IV / IO PROCEDURE**

- Appropriate Protocol Based on patient Signs and Symptoms
- TRANSPORT to appropriate facility
- CONTACT receiving facility
- CONSULT Medical Direction where indicated
- APPROPRIATE transfer of care

</table>
# HYPOTHERMIA / FROSTBITE

## HISTORY
- Past medical history
- Medications
- Exposure to environment even in normal temperatures
- Exposure to extreme cold
- Extremes of age
- Drug use: Alcohol, barbiturates
- Infections / sepsis
- Length of exposure / wetness

## SIGNS AND SYMPTOMS
- Cold, clammy
- Shivering
- Mental status changes
- Extremity pain or sensory abnormality
- Bradycardia
- Hypotension or shock

## DIFFERENTIAL DIAGNOSIS
- Sepsis
- Environmental exposure
- Hypoglycemia
- CNS dysfunction
- Stroke
- Head injury
- Spinal cord injury

## KEY POINTS
- Exam: Mental Status, Heart, Lungs, Abdomen, Extremities, Neuro
- Hypothermic / drowning / near drowning patients that appear cold and dead are NOT dead until they are warm and dead, or have other signs of obvious death (putrification, traumatic injury unsustainable to life).
- Defined as core temperature < 95° F (35° C).
- Extremes of age are more susceptible (i.e. young and old).
- Patients with low core temperatures will not respond to ALS drug interventions. Maintain warming procedure and supportive care. Warming procedures includes removing wet clothing, limiting exposure, and covering the patient with warm blankets if available.
- Do not allow patients with frozen extremities to ambulate.
- Superficial frostbite can be treated by using the patient’s own body heat.
- Do not attempt to rewarm deep frostbite unless there is an extreme delay in transport, and there is a no risk that the affected body part will be refrozen. Contact Medical Command prior to rewarming a deep frostbite injury.
- With temperature less than 88° F (31° C) ventricular fibrillation is common cause of death. Handling patients gently may prevent this. (rarely responds to defibrillation).
- If the temperature is unable to be measured, treat the patient based on the suspected temperature.
- Hypothermia may produce severe bradycardia.
- Shivering stops below 90° F (32° C).
- Hot packs can be activated and placed in the armpit and groin area if available.
- Care should be taken not to place the packs directly against the patient’s skin.
- Consider withholding CPR if patient has organized rhythm. Discuss with Online Medical Control.
- All hypothermic patients should have resuscitation performed until care is transferred, or if there are other signs of obvious death (putrification, traumatic injury unsustainable to life).
- The most common mechanism of death in hypothermia is ventricular fibrillation. If the hypothermia victim is in ventricular fibrillation, CPR should be initiated. If V fib is not present, then all treatment and transport decisions should be tempered by the fact that V fib can be caused by rough handling, noxious stimuli or even minor mechanical disturbances, this means that respiratory support with 100% oxygen should be done gently, including intubation, avoiding hyperventilation.
- The heart is most likely to fibrillate between 85 - 88° F (29 - 31° C) Defibrillate VF / VT at 2 – 4 j / kg with effective CPR intervals.
- Do not allow patients with frozen extremities to ambulate.
- Superficial frostbite can be treated by using the patient’s own body heat.
- Do not attempt to rewarm deep frostbite unless there is an extreme delay in transport, and there is a no risk that the affected body part will be refrozen. Contact Online Medical Control prior to rewarming a deep frostbite injury.

**Categories of Seizures**

- Complex = Unconscious
- Focal = Partial, Localized
- Simple = Conscious
- Generalized = All Body

**KEY POINTS**

- **Exam:** Mental Status, HEENT, Heart, Lungs, Extremities, Neuro
- **Status Epilepticus** is defined as two or more successive seizures without a period of consciousness or recovery. This is a true emergency requiring rapid airway control, treatment, and transport.
- **Grand mal seizures** (generalized) are associated with loss of consciousness, incontinence, and tongue trauma.
- **Focal seizures** (petit mal) effect only a part of the body and are not usually associated with a loss of consciousness.
- **Jacksonian seizures** are seizures, which start as a focal seizure and become generalized.
- Be prepared to assist ventilations especially if a benzodiazepine such as LORAZEPAM (ATIVAN) or MIDAZOLAM (VERSED) is used.
- If evidence or suspicion of trauma, spine should be immobilized.
- If febrile, remove clothing and sponge with room temperature water.
- **In an infant, a seizure may be the only evidence of a closed head injury.**
- Older than 6 years and febrile, it is not considered a febrile seizure.
SEVERE PAIN MANAGEMENT

PATIENT HAS:
- Burns
- Intractable Flank Pain
- Intractable Back Pain
- Musculoskeletal and/or Fracture Pain
- Sickle Cell Pain Crisis (Use Supplemental O2)
- Unremitting Abdominal Pain

CARDIAC MONITOR

CAPNOGRAPHY PROCEDURE

fentaNYL (SUBLIMAZE)
1 mcg/kg IV/IO/IN/IM up to 50 mcg/dose

PAIN SCALE

The Wong-Baker Faces Pain Rating Scale

Designed for children aged 3 years and older, the Wong-Baker Faces Pain Rating Scale is also helpful for elderly patients who may be cognitively impaired. It offers a visual description for those who don't have the verbal skills to explain how their symptoms make them feel.

To use this scale, your doctor should explain that each face shows how a person in pain is feeling. That is, a person may feel happy because he or she has no pain (hurt), or a person may feel sad because he or she has some or a lot of pain.

A Numerical Pain Scale

A numerical pain scale allows you to describe the intensity of your discomfort in numbers ranging from 0 to 10 (or greater, depending on the scale). Rating the intensity of sensation is one way of helping your doctor determine treatment. Numerical pain scales may include words or descriptions to better label your symptoms, from feeling no pain to experiencing excruciating pain. Some researchers believe that this type of combination scale may be most sensitive to gender and ethnic differences in describing pain.

KEY POINTS

• Exam: Mental Status, Area of Pain, Neuro
• Pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage.
• Pain is subjective (whatever the patient says it is).
• Pain severity (0-10) is a vital sign to be recorded pre and post medication delivery and at disposition.
• Vital signs should be obtained pre, 10 minutes post, and at disposition with all pain medications.
• Contraindications to morphine use include hypotension, head injury, and respiratory distress.
• All patients should have drug allergies documented prior to administering pain medications.
• All patients who receive pain medications must be observed 15 minutes for drug reaction.
• All patients who receive medication for pain must have continuous ECG monitoring, pulse oximetry, and oxygen administration.
• The patient’s vital signs must be routinely reassessed.
• Routine assessments and reassessments must be documented on the run report.
• Have Naloxone (Narcan) on hand if the patient has respiratory depression or hypotension after fentanyl (SUBLIMAZE) administration.
• **NOT FOR** Altered Mentation, Traumatic Abdominal Pain, Head Trauma, Hypovolemia, Multiple Trauma
PEDIATRIC PROTOCOL

UNIVERSAL PATIENT CARE PROTOCOL

AIRWAY PROTOCOL
- Monitor Lung Sounds for Fluid Overload

OXYGEN

IV / IO PROCEDURE
- Apply Cardiac Monitor and Assess Vitals

CAPNOGRAPHY PROCEDURE

Decontaminate and remove clothes if patient is exposed to any dangerous or noxious substances

Narcotic Overdose
AMS / Respiratory Depression

TAKE PPE PRECAUTIONS
- GLOVES / MASK minimum Contact / aerosol risk with fentanyl-based substances

ASSURE BLS VENTILATION WITH BVM
- Support Hemodynamically Utilize Shock Protocol

NALOXONE (NARCAN)
- 1 mg IN Atomized SUMMON ALS IF NO RESPONSE TO IN DOSE

NALOXONE (NARCAN)
- 0.1 mg / kg IV / IM / IN / IO

May repeat every 2 min as necessary if obvious or suspected opiate OD until respiratory improvement or 12 mg Max

If patient is unresponsive to Naloxone (Narcan), supply is exhausted, or the medication is unavailable, consider Advanced Airway and Support Hemodynamically

Tricyclic Anti – Depressants / Sodium Channel Blocker

Patient on any TRICYCLIC listed below or otherwise with QRS > 0.12
- Adapin
- Doxepin
- Anafranil
- Clomipramine
- Elavil
- Amitriptyline

- Maprotiline
- Ludomiil
- Desipramine
- Norpramin
- Doxepin
- Pamelor
- Nortriptyline
- Pertofran
- Trimipramine
- Sinequan
- Imipramine

SODIUM BICARBONATE
- 1 mEq / kg
- Until QRS narrows / condition improves
- Max dose 50 mEq / dose

TRANSCUTANEOUS PACING PROCEDURE

IV NORMAL SALINE BOLUS
- 10 – 20 ml / kg
- May Repeat up to 3 times as required

Contact Medical Control for the use of vasopressors if failed fluid bolus EPINEPHrine (Adrenaline)
PUSH DOSE Make 10 mcg / ml

1 mcg / kg
- Max Dose 10 mcg
- 2 - 5 min - slow push Titrate to effect

Treat with specific antidote

Calcium Channel Blockers OD CALCIUM GLUCONATE
- 60 mg / kg max
- 3 grams
- Over 10 min
- or CALCIUM CHLORIDE
- 20 mg / kg IV / IO
- Max 1 gram

Beta Blocker / Calcium Channel Blocker

Organophosphates / Carbamates

ATROPINE
- 0.05 mg kg – max 1 mg per dose – IV / IO
- Repeat every 3 – 5 Minutes or as needed to control secretions

Given to dry secretions

No max dose

Large doses likely necessary

POISON CONTROL 1-800-222-1222

KEY POINTS

- Exam: Mental Status, Skin, HEENT, Heart, Lungs, Abdomen, Extremities, Neuro
- Do not rely on patient history of ingestion, especially in suicide attempts.
- Bring bottles, contents, and emesis to ED.
- **Tricyclic**: 4 major areas of toxicity: seizures, dysrhythmias, hypotension, decreased mental status or coma; rapid progression from alert mental status to death.
- **Acetaminophen**: initially normal or nausea / vomiting. If not detected and treated, causes irreversible liver failure.
- **Depressants**: decreased HR, decreased BP, decreased temperature, decreased respirations, non-specific pupils.
- **Stimulants**: increased HR, increased BP, increased temperature, dilated pupils, and seizures.
- **Anticholinergic**: increased HR, increased temperature, dilated pupils, and mental status changes.
- **Cardiac Medications**: dysrhythmias and mental status changes.
- **Solvents**: nausea, vomiting, and mental status changes.
- **Insecticides**: increased or decreased HR, increased secretions, nausea, vomiting, diarrhea, pinpoint pupils.
- Consider restraint if necessary for patient’s and / or personnel’s protection per the Restraint Procedure.
- If it can be done safely, take whatever container the substance came from to the hospital along with readily obtainable samples of medication unless this results in an unreasonable delay of transport.
- If applicable, DO NOT transport a patient to the hospital until properly decontaminated.
- Medical Direction may order antidotes for specific ingestions.
- DO NOT use syrup of ipecac.
- Be aware of AMS as potential sign of an environmental toxin or Haz-Mat exposure and protect personal safety.
- It is safer to assume hypoglycemia than hyperglycemia if doubt exists.
- Do not let alcohol confuse the clinical picture. Alcoholics frequently develop hypoglycemia and need Thiamine before glucose.
- Low glucose (< 60), normal glucose (60 - 120), high glucose ( > 250).
- Protect the patient airway and support ABCs.
- Document the patient’s Glasgow coma score pre and post treatment.
- Signs and symptoms of narcotic overdose include respiratory depression and altered mental status.
- Naloxone (Narcan) administration may cause the patient to go into acute opiate withdrawal, which includes vomiting, agitation, and / or combative behavior. Always be prepared for combative behavior.
- Naloxone (Narcan) may wear off in as little as 20 minutes causing the patient to become more sedate and possibly hyperventilate. All A&O 4 patients having received Naloxone (Narcan) should be transported. If patient refuses transport, contact Online Medical Control before release.

The Golden Period

GUIDELINES FOR LOAD AND GO TRAUMA TRANSPORTS

INDICATIONS
- Uncorrectable airway obstruction
- Tension pneumothorax
- Pericardial tamponade
- Penetrating chest wounds with signs of shock
- Hemothorax with signs of shock
- Head trauma with unilaterally dilated pupils
- Head trauma with rapidly deteriorating condition
- Unconsciousness

KEY POINTS
- A trauma victim is a pediatric patient if they are less than 16 years old.
- Once the patient is determined to be an actual or potential major trauma / multiple system patient, personnel on scene and / or medical control must quickly determine the appropriate course of action including:
  1. Requesting aeromedical evacuation from scene. See AEROMEDICAL TRANSPORT PROCEDURE.
  2. Ground transportation directly to an appropriate facility.
- Major trauma patients are to be transported to the closest Trauma Center.
- Contact the receiving hospital for all major trauma or critical patients.
- Cover open wounds, burns, and eviscerations.
- Except for airway control, initiate ALS enroute when transporting major trauma patients.
- If the EMT is unable to access patient airway and ventilate, transport to the closest facility for airway stabilization.
- The on-scene time for major trauma patients should not exceed 10 minutes without a documented, acceptable reason for the delay.
- All major trauma patients should receive oxygen administration, an IV(s), and cardiac monitoring.
- Provide a documented reason if an intervention could not be performed.

Mass Casualty Incidents (MCI)
- Upon arrival at an MCI, the first arriving unit should notify their dispatch of the need to implement the mass casualty plan, call for additional resources, establish a safe staging area, and estimate the total number of victims.
- Each EMS service has a pre-defined coordinating hospital based on their county’s mass casualty plan. It is the responsibility of the responding jurisdiction to notify their appropriate coordinating hospital as soon as possible, giving a brief description of the incident and the estimated number of victims. The coordinating hospital will then notify the receiving hospitals of the MCI. The transportation officer should maintain a constant contact with the coordinating hospital until the scene has been cleared of salvageable victims.

THE GOLDEN PERIOD FOR THE PATIENT BEGINS WHEN THE TRAUMA HAPPENS
DO NOT WASTE VALUABLE TIME ON SCENE
Emergency medical service personnel shall use the following criteria, consistent with their certification, to evaluate whether an injured person qualifies as an adult trauma victim or pediatric trauma victim, in conjunction with the definition of trauma according to the State of Ohio Trauma Triage Guidelines.

A Pediatric Trauma Victim is a person < 16 years of age exhibiting one or more of the following physiologic or anatomic conditions

<table>
<thead>
<tr>
<th>Physiologic conditions</th>
<th>Anatomic conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Glasgow Coma Scale &lt; 13;</td>
<td>• Penetrating trauma to the head, neck, or torso;</td>
</tr>
<tr>
<td>• Loss of consciousness &gt; 5 minutes;</td>
<td>• Significant, penetrating trauma to extremities proximal to the knee or elbow with evidence of neurovascular compromise;</td>
</tr>
<tr>
<td>• Deterioration in level of consciousness at the scene or during transport;</td>
<td>• Injuries to the head, neck, or torso where the following physical findings are present;</td>
</tr>
<tr>
<td>• Failure to localize to pain;</td>
<td>• Visible crush injury;</td>
</tr>
<tr>
<td>• Evidence of poor perfusion, or evidence of respiratory distress or failure.</td>
<td>• Abdominal tenderness, distention, or seatbelt sign;</td>

KEY POINTS

Exceptions to Mandatory Transport to a Trauma Center:

- Emergency Medical Service personnel shall transport a trauma victim directly to an adult or pediatric trauma center that is qualified to provide appropriate adult or pediatric care, unless one or more of the following exceptions apply:

  1. It is medically necessary to transport the victim to another hospital for initial assessment and stabilization before transfer to an adult or pediatric trauma center;
  2. It is unsafe or medically inappropriate to transport the victim directly to an adult or pediatric trauma center due to adverse weather or ground conditions or excessive transport time;
  3. Transporting the victim to an adult or pediatric trauma center would cause a shortage of local emergency medical service resources;
  4. No appropriate adult or pediatric trauma center can receive and provide adult or pediatric trauma care to the trauma victim without undue delay;
  5. Before transport of a patient begins, the patient requests to be taken to a hospital that is not a trauma center or, if the patient is less than eighteen years of age or is not able to communicate, such a request is made by an adult member of the patient’s family or a legal representative of the patient.

**NOTS Pediatric Trauma Field Triage**

**Step 1 - Measure vital signs and level of consciousness of patient with a traumatic mechanism**
- Glasgow Coma Scale < 13 with traumatic mechanism
- Age specific hypotension and/or
- Requiring airway/ventilator support

**Step 2 - Assess anatomy of injury**
- Significant penetrating injuries to the head, neck, torso or extremities proximal the elbow or knee
- Two or more proximal long-bone fractures
- Crushed, degloved, threatened, pulseless or mangled extremity
- Amputation proximal to wrist or ankle
- Pelvic fractures
- Open or depressed skull fracture
- Paralysis

**Step 3 - Assess mechanism of injury and evidence of high-energy impact**
- Falls
  - 10 ft. or 2-3 times the height of the child
- High-risk auto crash
  - Intrusion: Including roof: > 12 in. occupant site, >18 in. any site
  - Extrication time over 20 minutes
  - Ejection (partial or complete) from automobile
  - Death in same passenger compartment
  - Vehicle telemetry data consistent with high risk of injury
- Auto vs. Pedestrian/Bicyclist thrown, run over or with significant (> 20 mph) impact
- Motorcycle crash > 20 mph
- Other motorized equipment crashes where the patient has the potential of significant injury
- Signs of suspicion of abuse

**Step 4 - Assess special patient or system considerations of trauma patients**
- Anticoagulant and bleeding disorders on prescription blood thinners
- Significant burns (+/- trauma mechanism) or inhalation injury, chemical injury electrical injury or frostbite triage to burn center
- Open fractures regardless
- Pregnancy > 20 weeks gestation
- EMS Provider Judgment- When in doubt transfer to a trauma center

**Step 5 - Patients not meeting above criteria**

**NOTS Transfer Line:**
1-216-778-7850

**Scene Referrals**

- **Level I Pediatric Trauma Center:** Rainbow Babies and Children’s Hospital- 1-877-842-3822
- **Level II Pediatric Trauma Center:** MetroHealth Medical Center- 1-800-233-5433

**Red/Priority 1**
Take to a Pediatric Trauma Center. If transport to a Pediatric Trauma center will add greater than 15 minutes, transport to the nearest trauma center.

**Yellow/Priority 2**
Transport patient to nearest trauma center within trauma system, need not be the highest level of trauma center.

**Green/Priority 3**
Transport to the closest appropriate emergency department.
ABDOMINAL TRAUMA

**UNIVERSAL PATIENT CARE PROTOCOL**

**PEDIATRIC AIRWAY PROTOCOL**

**CONSIDER SPINAL MOTION RESTRICTION PROCEDURE**

**Determine if Load & Go**

**Control Hemorrhage / Dress Wounds**

**CAPNOGRAPHY PROCEDURE**

**Evisceration:** Cover, clean saline dressing to loosely stabilize

**Penetrating Object:** Cover, clean saline dressing – Immobilize object. If too large to transport – attempt to cut with care not to further injure tissue

**Penetrating Wounds:** Cover, clean saline dressing. Look for exit wound

**Blunt Trauma:** Assess for change – distention. Note mechanism

**IV / IO PROCEDURE**

Normal Saline Bolus to maintain SBP

**Monitor and Reassess**

**TRANSPORT** to appropriate facility

**CONTACT** receiving facility

**CONSULT** Medical Direction where indicated

**APPROPRIATE** transfer of care

**Pediatric Multiple Trauma Protocol if criteria**

Fluid Resuscitate to systolic of 70 + 2 * age

KEY POINTS

Trauma to the abdomen is either Blunt or Penetrating. Blunt injuries are harder to detect and diagnose, and have a death rate twice that of penetrating wounds. Key signs and symptoms of blunt trauma include a patient in shock with no obvious injuries. Distention of the abdomen is an indication of internal hemorrhage. Pain may not be a significant factor. Many abdominal trauma injuries are Load & Go cases.

- Look for both an entrance and exit wound for all penetrating trauma, and treat accordingly.
- For all major trauma patients, the on scene time should be less than ten minutes.

**Universal Patient Care Protocol**

- Consider Spinal Motion Restriction Procedure

**Pediatric Airway Protocol**

- Capnography Procedure
  - If Chest, Neck, Face, Airway Involvement – Prepare for Invasive Airway Procedures
  - Perform Early Intubation

- Remove rings, bracelets, and other constricting items

**Thermal**

- If burn < 10% body surface area (using rule of nines)
- Cool down wound with NORMAL SALINE and dressings
- Cover burn with dry sterile sheet or dressings
- IV / IO Procedure
  - Only if Burns > 15% (KVO Otherwise)
  - Age 0 - 5 - Then 20 drops / min (Macrodrip set)
  - Age 6 - 13 – Then 40 drops / min (Macrodrip set)
  - Age 13 + - Then 60 drops / min (Macrodrip set)

**Chemical**

- Eye Injury
  - Continuous flushing with Normal Saline
- Remove clothing and / or expose area
- Flush area with NORMAL SALINE for 10 – 15 minutes
- IV / IO Procedure
- Pediatric Severe Pain Protocol

**Pediatric Severe Pain Protocol**

- Initiate Trauma Alert
  - Transport to appropriate facility
  - Contact receiving facility
  - Consult Medical Direction where indicated
  - Appropriate transfer of care

**EMT Intervention**

**AEMT Intervention**

**Paramedic Intervention**

**Online Medical Control**

*Northeast Ohio Regional EMS Protocol* - 8 | 11
**BURNS**

**HISTORY**
- Type of exposure (heat, gas, chemical)
- Inhalation injury
- Time of injury
- Past medical history
- Medications
- Other trauma
- Loss of consciousness
- Tetanus / immunization status

**SIGNS AND SYMPTOMS**
- Burns, pain, swelling
- Dizziness
- Loss of consciousness
- Hypotension / shock
- Airway compromise / distress
- Singed facial or nasal hair
- Hoarseness / wheezing

**DIFFERENTIAL DIAGNOSIS**
- Superficial (1°) red and painful
- Partial thickness (2°) superficial partial thickness, deep partial thickness, blistering
- Full thickness (3°) painless and charred or leathery skin
- Chemical
- Thermal
- Electrical
- Radiation

**KEY POINTS**
- **Exam:** Mental Status, HEENT, Neck, Heart, Lungs, Abdomen, Extremities, Back, Neuro
- Early intubation is required in significant inhalation injuries with airway compromise.
- Critical Burns: >25% body surface area (BSA); full thickness burns >10% BSA; partial thickness superficial partial thickness, deep partial thickness, and full thickness burns to face, eyes, hand or feet; electrical burns; respiratory burns; deep chemical burns; burns with extremes of age or chronic disease; and burns with associated major traumatic injury. These burns may require hospital admission or transfer to a burn center.
- Potential CO exposure should be treated with 100% oxygen.
- Circumferential burns to extremities are dangerous due to potential vascular compromise partial thickness to soft tissue swelling.
- Burn patients are prone to hypothermia – Never apply ice or cool burns that involve >10% body surface area.
- Do not overlook the possibility of multiple system trauma.
- Do not overlook the possibility of child abuse with children and burn injuries.
- See appendix for rule of nines.

1. **Thermal (dry and moist):**
   - a. Stop burning process: i.e. remove patient from heat source, cool skin, remove clothing
   - b. If patient starts to shiver or skin is cool, stop cooling process.
   - c. Estimate extent (%) and depth of burn (see chart). Determine seriousness (see chart) of burn, contact Medical Control and transport accordingly.
     - Cover burn areas with sterile dressing.

2. **Radiation Burns:**
   - a. Treat as thermal burns except when burn is contaminated with radioactive source, then treat as chemical burn.
   - b. Wear appropriate protective clothing when dealing with contamination.
   - c. Contact HAZ MAT TEAM for assistance in contamination cases.

3. **Chemical Burns:**
   - a. Wear appropriate protective clothing and respirators.
   - b. Remove patient from contaminated area to decontamination site (NOT SQUAD).
   - c. Determine chemicals involved; contact appropriate agency for chemical information.
   - d. Remove patient’s clothing and flush skin.
   - e. Leave contaminated clothes at scene. Cover patient over and under before loading into squad.
   - f. Patient should be transported by personnel not involved in decontamination process.
   - g. Determine severity (see chart), contact Medical Control and transport accordingly.
   - h. Relay type of substance involved to Medical Control.

4. **Electrical Burns:**
   - a. Shut down electrical source; do not attempt to remove patient until electricity is CONFIRMED to be shut off.
   - b. Assess for visible entrance and exit wounds and treat as thermal burns.
   - c. Assess for internal injury, i.e., vascular damage, tissue damage, fractures, and treat accordingly.
   - d. Determine severity of burn, contact Online Medical Control and transport accordingly.

5. **Inhalation Burns:**
   - a. Always suspect inhalation burns when the patient is found in closed smoky environment and / or exhibits any of the following: burns to face / neck, singed nasal hairs, cough and / or stridor, soot in sputum.
   - b. Provide oxygen therapy, contact Online Medical Control and transport.
   - c. Handle patients gently to avoid further damage of the patient’s skin.
   - d. If the patient is exposed to a chemical, whenever possible, get the name of the chemical, and document it on the patient run report. **DO NOT** transport any hazardous materials with the patient.
   - e. Look for signs of dehydration and shock.
   - f. Initiate early intubation for symptomatic patients with inhalation burns.
   - g. Patients with major burns should be transported to a Regional Burn Center.
   - h. Patients with unstable airway or who are rapidly deteriorating should be transported to the closest appropriate facility.
   - i. Patients with large surface burns lose the ability to regulate their body temperature. Avoid heat loss by covering the patient.
CHEST TRAUMA

UNIVERSAL PATIENT CARE PROTOCOL

SPINAL MOTION RESTRICTION PROCEDURE

AIRWAY PROTOCOL

HIGH FLOW OXYGEN

CAPNOGRAPHY PROCEDURE

If S&S of Tension Pneumothorax (No lung sounds on affected side, Hypotension, JVD) NEEDLE CHEST DECOMPRESSION PROCEDURE

⚠ Be Prepared to Repeat IF S&S Return

IV / IO PROCEDURE
Normal Saline Bolus to maintain SBP / Radial Pulses

APPLY CARDIAC MONITOR

Cardiac Tamponade: Assess for Beck’s Triad (Hypotension, + JVD and muffled heart sounds). Paradoxical Pulse (no radial pulse when breathing in) is likely. LOAD AND GO

Massive Hemothorax: Shock, then difficulty breathing. No JVD, decreased breath sounds, dull to percussion. LOAD AND GO

Open Pneumothorax / Sucking Chest Wound: Occlusive dressing secured on three sides or Commercial Chest Seal, allowing air escape. Prepare for tension pneumothorax. LOAD AND GO

Flail Chest: Assist with Ventilation – Gentle Positive Pressure LOAD AND GO

Suspected: Traumatic Aortic Rupture, Tracheal or Bronchial Tree Injury, Myocardial Contusion, Diaphragmatic Tears, Esophageal Injury, Pulmonary Contusion: Ensure an Airway, Administer Oxygen, LOAD AND GO

INITIATE TRAUMA ALERT

TRANSPORT to appropriate facility

### CARDIAC TAMPOONADE

- Hypotension
- Decreasing pulse pressure
- Elevated neck veins
- Muffled heart tones
- Bruising over the sternum
- Tachycardia

### TRAUMATIC ASPHYXIA

- Bloodshot, bulging eyes
- Blue, bulging tongue
- JVD
- Cyanotic upper body

### FLAIL CHEST

- Paradoxical chest wall movement
- Asymmetric chest movement
- Upon inspiration
- Dyspnea
- Unstable chest segment
- Significant chest wall pain

**Fluid Resuscitate to systolic of 70 + 2 x age**

**KEY POINTS**

Thoracic injuries have been called the deadly dozen. The first six are obvious at the primary assessment.

1. Airway obstruction
2. Flail chest
3. Cardiac tamponade
4. Massive hemothorax
5. Open pneumothorax
6. Tension pneumothorax

The second six injuries may be subtle and not easily found in the field:

7. Traumatic aortic rupture
8. Esophageal injury
9. Myocardial contusion
10. Diaphragmatic tears
11. Tracheal / bronchial tree injury
12. Pulmonary contusion

- **A sucking chest wound** is when the thorax is open to the outside. The occlusive dressing may be anything such as petroleum gauze, plastic, or a defibrillator pad. Tape only 3 sides down so that excess intrathoracic pressure can escape, preventing a tension pneumothorax. May help respirations to place patient on the injured side, allowing unaffected lung to expand easier.

- **A flail chest** is when there are extensive rib fractures present, causing a loose segment of the chest wall resulting in paradoxical and ineffective air movement. Positive pressure breathing via BVM will help push the segment and the normal chest wall out with inhalation and to move inward together with exhalation, getting them working together again. Do not use too much pressure to prevent additional damage or pneumothorax.

- **A penetrating object** must be immobilized by any means possible. If it is very large, cutting may be possible, with care taken not to move it about when making the cut. Place an occlusive and bulky dressing over the entry wound.

- **A tension pneumothorax** is life threatening, look for HYPOTENSION, unequal breath sounds, JVD, increasing respiratory distress, and decreasing mental status. The pleura must be decompressed with a needle to provide relief. Decompress between the 2nd and 3rd ribs, midclavicular placing the catheter over the 3rd rib. Alternate site, 5th intercostal space mid axillary or anterior axillary line. Once the catheter is placed, watch closely for reocclusion. Once the catheter is placed, watch closely for re-occlusion. Repeat if needed to prevent re-occlusion. Use appropriately sized catheter for age.
### DROWNING / NEAR DROWNING

#### UNIVERSAL PATIENT CARE PROTOCOL

**CONSIDER SPINAL MOTION RESTRICTION PROCEDURE**

**PEDIATRIC AIRWAY PROTOCOL**
- Initiate ventilation while patient is still in water if not breathing.
- Provide high flow oxygen ASAP.

**CAPNOGRAPHY PROCEDURE**

**IF DECOMPRESSION SICKNESS**
- Give oxygen – no positive pressure ventilation unless NOT breathing.

- **Apply Cardiac Monitor**

- **IF HYPOTHERMIC**
  - Treat per Hypothermia Protocol

- **IV / IO PROCEDURE**
  - Normal Saline TKO

- **Monitor and Reassess**

- **TRANSPORT** to appropriate facility
  - **CONTACT** receiving facility
  - **CONSULT** Medical Direction where indicated
  - **APPROPRIATE** transfer of care

---

### HISTORY
- Submersion in water regardless of depth
- Possible trauma i.e.; fall, diving board
- Duration of immersion
- Temperature of water
- Salt vs. fresh water

### SIGNS AND SYMPTOMS
- Period of unconsciousness
- Unresponsive
- Mental status changes
- Decreased or absent vital signs
- Vomiting
- Coughing

### DIFFERENTIAL DIAGNOSIS
- Trauma
- Pre-existing medical problem
- Barotrauma (diving)
- Decompression sickness

### KEY POINTS
- Exam: Trauma Survey, Head, Neck, Chest, Abdomen, Pelvis, Back, Extremities, Skin, Neuro
- Drowning due to suffocation from submersion in water.
- 2 causes – breath holding which leads to aspiration of water; & laryngospasm which closes the glottis.
- Both causes lead to profound hypoxia and death.
- Fresh water drowning ventricular fibrillation may be likely.
- Salt water drowning may cause pulmonary edema in time.
- Pulmonary edema can develop within 24 - 48 hours after submersion.
- All victims should be transported for evaluation due to potential for worsening over the next several hours.
- Drowning is a leading cause of death among would-be rescuers.
- Allow appropriately trained and certified rescuers to remove victims from areas of danger.
- With pressure injuries (decompression / barotrauma), consider transport for availability of a hyperbaric chamber.
- All hypothermic / drowning patients should have resuscitation performed until care is transferred, or if there are other signs of obvious death (putrification, traumatic injury unsustainable to life).
- A drowning patient is in cardiac arrest after the submersion.
- Consider SPINAL MOTION RESTRICTION in all drowning cases. Always immobilize a drowning patient.
- Patients with low core temperatures will not respond to ALS drug interventions. Maintain warming procedures and supportive care.
- DO NOT perform the Heimlich maneuver to remove water from the lungs prior to resuscitation.
Consider Pediatric Multiple Trauma Protocol

PEDIATRIC SEVERE PAIN MANAGEMENT PROTOCOL

Amputation?
- Clean amputated part with normal saline irrigation
- Wrap part in sterile dressing and place in plastic bag if able
- Place on ice if available – no direct contact to tissue

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care

BLEEDING / HEMORRHAGE CONTROL PROCEDURE

Risk of Exsanguination?
Internally or Externally
Upper Extremities Apply Tourniquet
Lower Extremities 2 Tourniquets if needed

OXYGEN

IV / IO PROCEDURE

UNIVERSAL PATIENT CARE PROTOCOL

EXTREMITY TRAUMA / AMPUTATION

<table>
<thead>
<tr>
<th>HISTORY</th>
<th>SIGNS AND SYMPTOMS</th>
<th>DIFFERENTIAL DIAGNOSIS</th>
</tr>
</thead>
</table>
| • Type of injury  
• Mechanism: crush / penetrating / amputation  
• Time of injury  
• Open vs. closed wound / fracture  
• Wound contamination  
• Medical history  
• Medications | • Pain, swelling  
• Deformity  
• Altered sensation / motor function  
• Diminished pulse / capillary refill  
• Decreased extremity temperature | • Abrasion  
• Contusion  
• Laceration  
• Sprain  
• Dislocation  
• Fracture  
• Amputation |

KEY POINTS

- Exam: Mental Status, Extremity, Neuro
- In amputations, time is critical. Transport and notify medical control immediately, so that the appropriate destination can be determined.
- Hip dislocations and knee and elbow fracture / dislocations have a high incidence of vascular compromise.
- Urgently transport any injury with vascular compromise.
- Blood loss may be concealed or not apparent with extremity injuries.
- Lacerations must be evaluated for repair within 6 hours from the time of injury.

Extremity Trauma

- DO NOT take the time to splint injured extremities in major trauma patients unless it does not delay the scene time or prevents you from performing more pertinent patient care.
- Splint the extremity if the patient has signs and symptoms of a fracture or dislocation.
- Treat all suspected sprains or strains as fractures until proven otherwise.
- Splint the joint above and below for all suspected fractures.
- Splint the bone above and below for all suspected joint injuries.
- Check and document the patient’s MSP’s before and after splinting.
- A traction splint with a backboard is the preferred splint to use for femur fractures.

Traumatic Amputation

- Care of the amputated extremity include:
  - Cleanse an amputated extremity with normal saline or sterile water.
  - DO NOT place any amputated tissue directly on ice or cold pack. Instead, place the amputated limb into a plastic bag. Put the bag into a container of cool water with a few ice cubes (if available).
- Contact the receiving hospital with the patient information and include the status of the amputated limb.
- Focus on patient care and not on the amputated extremity.
- Tourniquets should be applied early if there is a risk of exsanguination (bleeding out) from extremity injury.
- Remember to calm and reassure the patient. Do not give the patient or their family member’s false hope of re-attachment of the affected limb. A medical team at the receiving hospital makes this decision.
- Delegate someone to do an on-scene search for the amputated part when it cannot be readily found and continue with patient care.
- Use only commercially available tourniquets.

Fluid Resuscitate to systolic of $70 + 2 \times \text{age}$

**KEY POINTS**

- Exam: Mental Status, HEENT, Heart, Lungs, Abdomen, Extremities, Back, Neuro
- If GCS $< 12$ consider air / rapid transport and if GCS $< 8$ intubation should be anticipated.
- Increased intracranial pressure (ICP) may cause hypertension and bradycardia (Cushing’s Response).
- Hypotension usually indicates injury or shock unrelated to the head injury.
- The most important item to monitor and document is a change in the level of consciousness.
- Concussions are periods of confusion or LOC associated with trauma, which may have resolved by the time EMS arrives. A physician should evaluate any prolonged confusion or mental status abnormality, which does not return to normal within 15 minutes or any documented loss of consciousness.
**MAXILLOFACIAL / EYE TRAUMA**

**UNIVERSAL PATIENT CARE PROTOCOL**

- **Eye**
  - Remove contact lenses (if applicable)
  - If burn or foreign body, determine substance. Flush with copious amounts of normal saline
  - If penetrating trauma, secure object (Do not remove)
  - Eye out; Cover with sterile 4 x 4, normal saline and stabilize

- **Tongue**
  - Have suction on and immediately available to maintain airway
  - Attempt to control bleeding with direct pressure / gauze if able and will not cause airway obstruction

- **Nose**
  - Have suction on and immediately available to maintain airway
  - Sit patient upright and forward. Pinch nostrils. Consider external applied cold pack to bridge of nose

- **Ear**
  - If foreign body, determine substance
  - Attempt to control bleeding with direct pressure / gauze

- **Tooth**
  - If tooth out attempt preservation as soon as possible in; Commercially available tooth preservation kit (if available) or whole milk (if available). Handle by enamel only, do not touch roots

**Determine type of injury**

- **If Non-Penetrating Trauma or Chemical Burns**
  - CONSIDER TOPICAL PAIN CONTROL TETRACAINE (PONTOCAINE)
  - 1 - 2 drops to affected eye

**Warning**
- If Tetracaine (Pontocaine) is used, patient must be evaluated at hospital

**TRANSPORT** to appropriate facility **CONTACT** receiving facility **CONSULT** Medical Direction where indicated **APPROPRIATE** transfer of care

MAXILLOFACIAL / EYE TRAUMA

<table>
<thead>
<tr>
<th>HISTORY</th>
<th>SIGNS AND SYMPTOMS</th>
<th>DIFFERENTIAL DIAGNOSIS</th>
</tr>
</thead>
</table>
| • Trauma of any type that results in injury to one or both eyes. | • Irritation to eye  
• Visual disturbances  
• Obvious penetrating injury  
• Burn (chemical, thermal)  
• Loss of vision  
• Dizziness  
• Loss of consciousness  
• Nausea | • Hypertension  
• Contact lens problem |

KEY POINTS

• If unsure if something can be flushed with water, contact Medical Command.
• A garden hose can be used to help flush the patient’s eye(s) if available. DO NOT use a high-pressure hose or at a high force. If needed, irrigate the patient’s eyes for approximately 5 -15 minutes.
• Begin irrigating immediately, because irreversible damage can occur in a few minutes.

TRAUMA

• Do not allow eye injury to distract you from the basics of trauma care.
• Do not remove any foreign body imbedded in the eye or orbit. Stabilize any large protruding foreign bodies.
• With blunt trauma to the eye, if time permits, examine the globe briefly for gross laceration as the lid may be swollen tightly shut later. Sclera rupture may lie beneath an intact conjunctiva.
• Covering both eyes when only one eye is injured may help to minimize trauma to the injured eye, but in some cases the patient is too anxious to tolerate this.
• Transport patient supine unless other life threats prohibit this from being done. (This is based on physics, the goal of not letting the fluid within the eye drain out of the eye)

CHEMICAL BURNS

• When possible determine type of chemical involved first. The eye should be irrigated with copious amounts of water or saline, using IV tubing wide open for a minimum of 15 minutes started as soon as possible. Any delay may result in serious damage to the eye.
• Always obtain name and, if possible, a sample of the contaminant or ask that they be brought to the hospital as soon as possible.

CONTACT LENSES

• If possible, contact lenses should be removed from the eye; be sure to transport them to the hospital with the patient. If the lenses cannot be removed, notify the ED personnel as soon as possible.
• If the patient is conscious and alert, it is much safer and easier to have the patient remove their lenses.

ACUTE, UNILATERAL VISION LOSS

• When a patient suddenly loses vision in one eye with no pain, there may be a central retinal artery occlusion. Urgent transport and treatment is necessary.
• Patient should be transported flat.

## HISTORY
- Time and mechanism of injury
- Damage to structure or vehicle
- Location in structure or vehicle
- Others injured or dead
- Speed and details of MVC
- Restraints / protective equipment
- Car seat
- Helmet
- Pads
- Ejection
- Past medical history
- Medications

## SIGNS AND SYMPTOMS
- Pain, swelling
- Deformity, lesions, bleeding
- Altered mental status
- Unconscious
- Hypotension or shock
- Arrest

## DIFFERENTIAL DIAGNOSIS
- Life Threatening:
  - Chest Tension pneumothorax
  - Flail chest
  - Pericardial tamponade
  - Open chest wound
  - Hemothorax
  - Intra-abdominal bleeding
  - Pelvis / femur fracture
  - Spine fracture / cord injury
  - Head injury (see Head trauma)
  - Extremity fracture / dislocation
  - HEENT (airway obstruction)
  - Hypothermia

A Pediatric Trauma Victim is a person < 16 years of age exhibiting one or more of the following physiologic or anatomic conditions

### Physiologic conditions
- Glasgow Coma Scale < 13;
- Loss of consciousness > 5 minutes;
- Deterioration in level of consciousness at the scene or during transport;
- Failure to localize to pain;
- Evidence of poor perfusion, or evidence of respiratory distress or failure.

### Anatomic conditions
- Penetrating trauma to the head, neck, or torso;
- Significant, penetrating trauma to extremities proximal to the knee or elbow with evidence of neurovascular compromise;
- Injuries to the head, neck, or torso where the following physical findings are present:
  - Visible crush injury;
  - Abdominal tenderness, distention, or seatbelt sign;
    - Pelvic fracture;
    - Flail chest;
- Injuries to the extremities where the following physical findings are present:
  - Amputations proximal to the wrist or ankle;
  - Visible crush injury;
  - Fractures of two or more proximal long bones;
  - Evidence of neurovascular compromise.
- Signs or symptoms of spinal cord injury;
- 2<sup>nd</sup> or 3<sup>rd</sup> Degree burns > 10% total BSA, or other significant burns involving the face, feet, hands, genitalia, or airway.

## KEY POINTS
- Exam: Mental Status, Skin, HEENT, Heart, Lung, Abdomen, Extremities, Back, Neuro
- Mechanism is the most reliable indicator of serious injury. Examine all restraints / protective equipment for damage.
- In prolonged extrications or serious trauma consider air transportation for transport times and the ability to give blood.
- Do not overlook the possibility for child abuse.
- A trauma victim is a pediatric patient if they are < 16 years old.
- Major trauma patients are to be transported to the closest pediatric trauma center.
- Contact the receiving hospital for all major trauma or critical patients.
- The Proper size equipment is very important to resuscitation care. Refer to length-based drug treatment guide (e.g. BROSELOW PEDIATRIC EMERGENCY TAPE OR SIMILAR GUIDE) when unsure about patient weight, age and / or drug dosage and when choosing equipment size.
- Cover open wounds, burns, eviscerations.
- Except for airway control, initiate ALS enroute when transporting major trauma patients.
- If unable to access patient airway and ventilate, then transport to the closest facility for airway stabilization.
- The on-scene time for major trauma patients should not exceed 10 minutes without documented, acceptable reason for the delay.
- When initiating an IV and drawing blood, collect a red top blood tube to assist the receiving hospital with determining the patient’s blood type.
- All major trauma patients should receive oxygen administration, an IV(s), and cardiac monitoring.
- Provide a documented reason if an intervention could not be performed.
- Transport to a Pediatric Trauma center when able

KEY POINTS

• Immediately transport traumatic cardiac arrest patients.
• With the exception of airway management, traumatic cardiac arrests are “load and go” situations.
• Resuscitation should not be attempted in cardiac arrest patients with spinal transection, decapitation, or total body burns, nor in patients with obvious, severe blunt trauma that are without vital signs, pupillary response, or an organized or shockable cardiac rhythm at the scene. Patients in cardiac arrest with deep penetrating cranial injuries and patients with penetrating cranial or truncal wounds associated with asystole and a transport time of more than 15 minutes to a definitive care facility are unlikely to benefit from resuscitative efforts.
• Extensive, time-consuming care of trauma victims in the field is usually not warranted. Unless the patient is trapped, they should be enroute to a medical facility within 10 minutes after arrival of the ambulance on the scene.

Blood pressure is a late and unreliable indicator of shock in children
1% is equal to the surface of the palm of the patient’s hand. If unsure of %, describe injured area.

**MAJOR BURN CRITERIA**

- 2° and 3° burns > 10% surface area
- Burns of the face, hands feet genitalia
- Electrical shock with burn injury
- Burn with inhalation injury any burn with potential functional or cosmetic impairment
Abnormal Birth Emergencies...........................................................................................................2-12
Obstetrical Emergencies ....................................................................................................................4-12
Uncomplicated / Imminent Delivery ..................................................................................................6-12
Neonatal Resuscitation ......................................................................................................................8-12
**ABNORMAL BIRTH EMERGENCIES**

**CORD AROUND NECK**
- Loosen cord or clamp and cut if too tight
- Continue delivery

**PROLAPSED CORD**
- Transport mother with hips elevated and knees to chest
- Insert fingers to relieve pressure on cord
- Cover cord with sterile saline dressing

**BREECH BIRTH**
- Transport unless delivery is imminent
  - If single limb presenting – Transport immediately
- Do not encourage mother to push
- Support but do not pull presenting parts

**SHOULDER DYSTOIA**
- Transport mother with hips elevated and knees to chest
- Insert fingers to relieve pressure on cord
- Place pressure above symphysis pubis

If delivery is in process and the head is clamped inside vagina, create air passage by supporting body of infant and placing 2 gloved forming a “V” and push away from face to facilitate an airway passage.

If unable to deliver, transport mother with hips elevated and knees to chest

**TRANSPORT** to appropriate facility
**CONTACT** receiving facility
**CONSULT** Medical Direction where indicated
**APPROPRIATE** transfer of care

Abnormal Birth Emergencies

Contact Receiving Facility IMMEDIATELY WHEN ANY ABNORMAL BIRTH PRESENTATION IS DISCOVERED

History
- Past medical history
- Hypertension meds
- Prenatal care
- Prior pregnancies / births
- Gravida / para
- Ultrasound findings in prenatal care

Signs and Symptoms
- Frank breech (buttocks presents first)
- Footling breech (one foot or both feet presenting)
- Transverse lie (fetus is on his / her side with possible arm or leg presenting)
- Face first presentation
- Prolapsed cord (umbilical cord presents first)

Differential Diagnosis
- Miscarriage
- Stillbirth

Key Points

General Information
- DO NOT pull on any presenting body parts.
- These patients will most likely require a c-section, so immediate transport is needed.
- Prolonged, non-progressive labor distresses the fetus and mother. Be sure to reassess mother’s vital signs continuously.
- Transport to an appropriate OB facility if the patient is pregnant.

Cord Around Baby’s Neck:
- As baby’s head passes out the vaginal opening, feel for the cord. Initially try to slip cord over baby’s head; if too tight, clamp cord in two places and cut between clamps.

Breech Delivery:
- Footling breech, which is one or both feet delivered first
- Frank breech, which is the buttocks first presentation
  - When the feet or buttocks first become visible, there is normally time to transport patient to nearest facility.
  - If upper thighs or the buttock have come out of the vagina, delivery is imminent.
  - If the child’s body has delivered and the head appears caught in the vagina, the EMT must support the child’s body and insert two fingers into the vagina along the child’s neck until the chin is located. At this point, the two fingers should be placed between the chin and the vaginal canal and then advanced past the mouth and nose.
  - After achieving this position, a passage for air must be created by pushing the vaginal canal away from the child’s face. This air passage must be maintained until the child is completely delivered.

Excessive Bleeding Pre-Delivery:
- If bleeding is excessive during this time and delivery is imminent, in addition to normal delivery procedures, the EMT should use the Hypovolemic Shock Protocol.
- If delivery is not imminent, patient should be transported on her left side and shock protocol followed.

Excessive Bleeding Post-Delivery:
- If bleeding appears to be excessive, start IV of saline.
- If placenta has been delivered, massage uterus and put baby to mother’s breast.
- Follow Hypovolemic Shock Protocol.

Prolapsed Cord:
- When the umbilical cord passes through the vagina and is exposed, the EMT should check cord for a pulse.
- The patient should be transported with hips elevated or in the knee chest position and a moist dressing around cord.
- If umbilical cord is seen or felt in the vagina, insert two fingers to elevate presenting part away from cord, distribute pressure evenly when occiput presents.
- DO NOT attempt to push the cord back. High flow oxygen and transport IMMEDIATELY.

Shoulder Dystocia:
- Following delivery of the head the shoulder(s) become “stuck” behind the symphysis pubis or sacrum of the mother.
- Occurs in approximately 1% of births.
### HISTORY
- Past medical history
- Hypertension meds
- Prenatal care
- Prior pregnancies / births
- Gravida (pregnancies) / para (live births)

### SIGNS AND SYMPTOMS
- Vaginal bleeding
- Abdominal pain
- Seizures
- Hypertension
- Severe headache
- Visual changes
- Edema of hands and face

### DIFFERENTIAL DIAGNOSIS
- Pre-eclampsia / eclampsia
- Placenta previa
- Placenta abruptio
- Spontaneous abortion

### KEY POINTS
- **Exam:** Mental Status, Abdomen, Heart, Lungs, Neuro

#### General Information
- Any woman of child bearing age with syncope should be considered an ectopic pregnancy until proven otherwise.
- May place patient in a left lateral position to minimize risk of supine hypotensive syndrome.
- Ask patient to quantify bleeding - number of pads used per hour.
- Any pregnant patient involved in a MVC should be seen immediately by a physician for evaluation and fetal monitoring.
- **DO NOT** apply packing into the vagina.
- Be alert for fluid overload when administering fluids.
- Consider starting a second IV if the patient is experiencing excessive vaginal bleeding or hypotension maintain BP 90 systolic, transport to an appropriate OB facility if the patient is pregnant.
- An abortion is any pregnancy that fails to survive over 20 weeks. When it occurs naturally, it is commonly called a "miscarriage".

#### Abortion / Miscarriage
- The patient may be complaining of cramping, nausea, and vomiting.
- Be sure to gather any expelled tissue and transport it to the receiving facility.
- Signs of infection may not be present if the abortion/miscarriage was recent.
- An abortion is any pregnancy that fails to survive over 20 weeks. When it occurs naturally, it is commonly called a "miscarriage".

#### Abruptio Placenta
- Usually occurs after 20 weeks.
- Dark red vaginal bleeding.
- May only experience internal bleeding.
- May complain of a “tearing” abdominal pain.

#### Ectopic Pregnancy
- The patient may have missed a menstrual period or had a positive pregnancy test.
- Acute unilateral lower abdominal pain that may radiate to the shoulder.
- Any female of childbearing age complaining of abdominal pain is considered to have an ectopic pregnancy until proven otherwise.

#### Pelvic Inflammatory Disease
- Be tactful when questioning the patient to prevent embarrassment.
- Diffuse back pain.
- Possibly lower abdominal pain.
- Pain during intercourse.
- Nausea, vomiting, or fever.
- Vaginal discharge.
- May walk with an altered gait do to abdominal pain.

#### Placenta Previa
- Usually occurs during the last trimester.
- Painless.
- Bright red vaginal bleeding.

#### Post-Partum Hemorrhage
- Post-partum blood loss greater than 300 - 500 ml.
- Bright red vaginal bleeding.
- Be alert for shock and hypotension.

#### Uterine Inversion
- The uterine tissue presents from the vaginal canal. Cover with sterile saline dressing.
- Be alert for vaginal bleeding and shock.

#### Pre-Eclampsia / Eclampsia
- Severe headache, vision changes, or RUQ pain may indicate pre-eclampsia.
- In the setting of pregnancy, hypertension is defined as a BP greater than 140 systolic and greater than 90 diastolic, or a relative increase of 30 systolic and 20 diastolic from the patient’s normal (pre-pregnancy) blood pressure.

#### Uterine Rupture
- Often caused by prolonged, obstructed, or non-progressive labor.
- Severe abdominal pain.

#### Vaginal Bleeding
- If the patient is experiencing vaginal bleeding, **DO NOT** pack the vagina, pad on outside only.
UNCOMPPLICATED DELIVERY

Contact Receiving Facility to Notify of Delivery
Observed Head Crowning

UNIVERSAL PATIENT CARE PROTOCOL

Prepare Patient for Delivery
Set-Up Equipment

IV PROCEDURE (if time) Not in AC
Normal Saline at KVO

Delivery of Head
Firm, gentle pressure with flat of hand to slow expulsion
Allow head to rotate normally, check for cord around neck,
wipe face free of debris
Suction mouth and nose with bulb syringe

Delivery of Body
Place one palm over each ear with next contraction gently
move downward until upper shoulder appears
Then lift gently to ease out lower shoulder
Support the head and neck with one hand and buttocks with other

Newborn and Cord
Keep newborn at level of vaginal opening
Keep warm and dry
After 10 seconds, clamp cord in two places with sterile equipment at least 6 - 8” from newborn
Cut between clamps

Allow placenta to deliver itself but do not delay transport while waiting
Take placenta to hospital with patient
DO NOT PULL-ON CORD TO DELIVERY PLACENTA!
Perform APGAR Score 1 min and 5 min post delivery

OXYTOCIN (PITOCIN)
10 Units IM
After Delivery
For all deliveries regardless off bleeding

TRANSPORT to appropriate facility
CONTACT receiving facility
CONSULT Medical Direction where indicated
APPROPRIATE transfer of care
Transport to Hospital with OB Facilities

EMT Intervention  AEMT Intervention  PARAMEDIC Intervention  Online Medical Control
## Northeast Ohio Regional EMS Protocol

### KEY POINTS

- Exam (of Mother): Mental Status, Heart, Lungs, Abdomen, Neuro
- Document all times (delivery, contraction frequency, and length).
- If maternal seizures occur, refer to the OBSTETRICAL EMERGENCIES PROTOCOL.
- After delivery, massaging the uterus (lower abdomen) will promote uterine contraction and help to control post-partum bleeding.
- Some bleeding is normal with any childbirth. Large quantities of blood or free bleeding are abnormal.
- Prepare to deliver on scene (protecting the patient’s privacy). If delivery becomes imminent while enroute, stop the squad and prepare for delivery.
- Newborns are very slippery, so be careful not to drop the baby.
- There is no need to wait on scene to deliver the placenta.
- If possible, transport between deliveries if the mother is expecting twins.
- Allow the placenta to deliver, but DO NOT delay transport while waiting.
- DO NOT PULL ON THE UMBILICAL CORD WHILE PLACENTA IS DELIVERING.
Maintain body heat of infant during and post resuscitation

**UNIVERSAL PATIENT CARE PROTOCOL (For Mother)**

**Dry Infant and Keep Warm**

**BVM 30 seconds at 40 – 60 Breaths per minute with ROOM AIR IF NOT BREATHING**

Suction only if airway appears obstructed

• Hypoglycemia  
• Congenital heart disease  
• Hypothermia |

KEY POINTS

• Exam: Mental Status, Skin, HEENT, Neck, Chest, Heart, Abdomen, Extremities, Neuro
• Newborn arrest is not a cardiac arrest, it is a respiratory arrest.
• Effective ventilation is key to successful resuscitation.
• Effective ventilation can be determined by; Chest rise, Bilateral breath sounds, and Increasing heart rate.
• Term baby resuscitation should begin with room air.
• If preterm baby, resuscitate with oxygen, but reservoir removed from BVM.
• Hypothermia is a common complication of home and field deliveries. Keep the baby warm and dry.
• Consider hypoglycemia in infant. If the BGL is less than 45 mg / dl then administer Dextrose 10%.
• Document 1 and 5-minute APGAR scores, but do not use it to guide your resuscitation steps.
• If the patient is in distress, consider causes such as; hypovolemia. Administer a 10 ml / kg fluid bolus of normal saline.
• If drying and suction has not provided enough stimulation, try rubbing the infant’s back or flicking their feet. If the infant still has poor respiratory effort, poor tone, or central cyanosis, consider them to be distressed, most distressed infants will respond quickly to BVM.
• Use caution not to allow newborns to slip from grasp.

## Pediatric Weight Based Dosing

Pediatric Drug Administration Charts ........................................................................ 56-13 thru 60-13
**MEDICATION INFORMATION**

**Medication Supply / Availability**

**Medical Director / EMS agency rights:**
These medications represent the medications approved by the protocol advisory board for inclusion in the EMS protocol. Each individual Medical Director reserves the right to choose not to supply or use medication included in the protocol at his / her discretion. The Medical Director also reserves the right to decide which (or all) agent to supply if multiple medications are listed for an application.

In situations where medications are not provided by the EMS agency or Medical Director, the EMS provider is NOT IN VIOLATION of protocol if they cannot provide a listed medication.

**Medication Availability:**
Medication shortages are an ongoing reality. Although, where available, this document lists available alternate medications, the alternate medications are not necessarily intended to be carried routinely. These agents are intended to be added to the drug box in the event of a shortage of the primary listed agent.

It is the individual Medical Directors and the individual agencies responsibility to communicate shortages and substitutions with the staff. It is the individual providers’ responsibility to review the protocols and dosing for substituted medications.
I. ACTIONS OF MEDICATIONS
   1. Local effects
   2. Systemic effects

II. EFFECTS DEPENDS UPON
   1. Age of patient
   2. Condition of patient
   3. Dosage
   4. Route of administration

III. ROUTE OF ADMINISTRATION
   1. Intravenous (IV)
      • Most rapidly effective
      • Most dangerous
      • Give SLOWLY through an established IV line (FOR MOST MEDICATIONS)
   2. Intramuscular (IM)
      • Takes longer to act
      • Longer duration of action (Oil vs. water-based medications duration varies)
      • Deltoid or gluteus maximus site
      • Absorption VERY dependent on blood flow
   3. Subcutaneous (SQ)
      • Slower and more prolonged absorption
      • Under skin of upper arms, thigh, abdomen
   4. Inhalation
      • Bronchodilators
      • Steroids (Patients may be prescribed)
   5. Endotracheal (Only administer through ET as a last resort with no better options)
      • EPINEPHrine (Adrenaline), Atropine, Lidocaine (Xylocaine), Naloxone (Narcan)
      • Medication dose must be twice the IV dose
   6. Sublingual (SL)
      • Rapid absorption
      • Patient must be well hydrated for good absorption
   7. Oral
      • Slow rate of absorption
   8. Rectal (PR)
      • Rapid but unpredictable absorption
   9. Intranasal (IN)
      • Must use specific device to aerosolize medication
   10. Intraosseous (IO)
      • IO is only to be used only if IV is unobtainable in an unconscious patient
      • Nearly as fast as IV route

IV. RATES OF ABSORPTION
   1. “Directly related to route of administration"
      • IV (Fastest)
      • IO (Intraosseous)
      • Inhalation
      • ET (Endotracheal)
      • IM (Intramuscular)
      • SL (Sublingual)
      • IN (intranasal)
      • PR (Rectal)
      • SQ (Subcutaneous)
      • Oral (Slowest)

V. ELIMINATION
   1. Many methods
   2. Usually metabolized by the liver
   3. Eliminated by the kidneys, lungs, skin
VI. TERMS
1. Indications – Conditions medications are used for
2. Contraindications – Conditions which make medication use improper
3. Depressants - Lessens / decreases activity
4. Stimulants - Increases activity
5. Physiologic action - Action from therapeutic concentrations of a medication
6. Therapeutic action - Beneficial action expected from a desired concentration of a medication
7. Untoward reaction - Unwanted side effect
8. Irritation - Damage to tissue
9. Antagonism - Opposition between physiologic action
10. Cumulative action - Increased action after repeated administration of medications
11. Tolerance - Decreased effects after repeated doses
12. Synergism - Combined effects greater than sum of individual effects
13. Potentiation - Enhancement of one medication by another
14. Habituation – Becoming abnormally tolerant to and dependent on something that is habit-forming
15. Idiosyncrasy - Abnormal response to a medication
16. Hypersensitivity - Exaggerated response or allergy to a specific agent

VII. AUTONOMIC NERVOUS SYSTEM
1. Parasympathetic - Controls vegetative functions “rest and digest”
2. Sympathetic - “flight or fight”

VIII. PARASYMPATHETIC NERVous SYSTEM
1. Mainly mediated by vagus nerve
2. Acetylcholine is transmitter (cholinergic)
3. Atropine is an acetylcholine blocker

IX. SYMPATHETIC NERVOUS SYSTEM
1. Mediated by Nerves from Sympathetic Chain
2. Norepinephrine and EPINEPhrine are the transmitters

X. SYMPATHETIC RECEPTORS
   Alpha (a) - Vasoconstriction
   Beta (b) – Heart rate / Contractility

XI. COMMON SYMPATHETIC AGENTS
   Isoproterenol (Isuprel) - pure BETA
   Epinephrine (Adrenalin) – ALPHA and BETA
   Dobutamine (Dobutrex) - predominately BETA
   Norepinephrine (Levophed) - predominately ALPHA
   DOPAmine (Intropin) - BETA at low dose range, ALPHA at high dose range
   Phenylephrine (Neo-Synephrine) - pure ALPHA

XII. SYMPATHETIC BLOCKERS
    Propranolol (Inderal) - BETA blocker

XIII. MEDICATION ADMINISTRATION
   Appropriate:
   1. Medication selection based on protocol
   2. Visually examine medication for particulates or discoloration and that the medication has not expired
   3. Contraindications are reviewed prior to administration
   4. Route is determined by protocol
   5. Dose selection based on protocol
   6. Dilution is per protocol
   7. Rate is per protocol
**Category A**

Controlled studies in women do not demonstrate a risk to the fetus. The possibility of fetal harm appears remote.

**Category B**

Either animal studies have not demonstrated a fetal risk but there are no controlled studies in pregnant women, or animal studies have shown an adverse effect that was not confirmed in controlled studies in women.

**Category C**

Either studies in animals have revealed adverse effects on the fetus and there are no controlled studies in women, or studies in women and animals are not available. Drugs in category C should only be taken if the benefit justifies the fetal risk.

**Category D**

There is positive evidence of human fetal risk (birth defects, etc.), but the benefits from use in pregnant women may be acceptable despite the risk.

**Category X**

Studies in animals or human beings have demonstrated fetal abnormalities or there is evidence of fetal risk based on human experience, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. Drugs in category X should not be taken by pregnant women for any reason.

**Category N**

</table>

| ACTIONS | 1. Slows conduction time and can interrupt re-entrant pathways through the AV node  
2. Slows the sinus rate |
|---------|-----------------|

| INDICATIONS | 1. Supra ventricular tachycardia (SVT)  
2. Monomorphic, regular wide complex arrhythmias |
|-------------|----------------|

| CONTRAINDICATIONS | 1. Atrial fibrillation  
2. Atrial flutter  
3. Polymorphic, irregular, or unstable ventricular tachycardia  
4. Heart blocks  
5. Known WPW |
|-------------------|---------------|

<table>
<thead>
<tr>
<th>PRECAUTIONS</th>
<th>Inform the patient of likely side effects prior to medication administration</th>

</thead>
</table>

| KEY POINTS | • Adenosine has a short half-life, and should be administered rapidly followed by a rapid IV flush  
• Reassess after each medication administration and refer to the appropriate protocol and treat accordingly  
• Perform a 12 Lead EKG prior to the administration of adenosine and after the rhythm converts  
• Record EKG during administration |

</tr>
</thead>
</table>
| ACTIONS          | 1. Relax bronchial smooth muscles  
                  2. Reduces airway resistance  
                  3. Relieves bronchospasm  
                  4. Dries bronchial secretions |
| INDICATIONS      | 1. Asthma exacerbation  
                  2. COPD exacerbation  
                  3. Pulmonary edema with wheezing |
| CONTRAINDICATIONS| Known hypersensitivity |
| PRECAUTIONS      | 1. Use caution when administering to pregnant women  
                  2. Patients with cardiac history  
                  3. Patients with seizure disorders  
                  4. **Not intended for use with hyperkalemia, use albuterol alone.** |
| SIDE EFFECTS     | 1. Headache  
                  2. Drowsiness  
                  3. Dizziness  
                  4. Restlessness  
                  5. Nausea / Vomiting  
                  6. Tachycardia  
                  7. Palpitations  
                  8. Hyper / hypotension  
                  9. Tremors  
                  10. PVCs  
                  11. Dry nose, Mouth |
| SUPPLIED         | 2.5 mg Albuterol and 0.5 mg Ipratropium in single unit dose |

#### ADULT DOSAGE

**Respiratory Distress / Asthma / COPD:**  
Single unit dose via nebulizer and 6 - 8 lpm oxygen

**Congestive Heart Failure with wheezing:**  
Single unit dose via nebulizer and 6 - 8 lpm oxygen

**Anaphylaxis:**  
Single unit dose via nebulizer and 6 - 8 lpm oxygen  
**EMT MUST CONTACT ONLINE MEDICAL CONTROL**

#### PEDIATRIC DOSAGE

**Respiratory Distress Lower Airway:**  
Mild Distress - Second and third doses use Albuterol / Ipratropium (DuoNeb) Unit dose via nebulizer and 6 – 8 lpm oxygen. First Dose – Use Albuterol Only  
Moderate / Severe Distress - Albuterol/Ipratropium (DuoNeb) Unit dose via nebulizer and 6 – 8 lpm oxygen.

**EMT MUST CONTACT ONLINE MEDICAL CONTROL**

#### KEY POINTS

- May repeat treatments as required
## MEDICATIONS

### AMIODARONE (Cordarone)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>X – <strong>USE LIDOCAINE instead</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIONS</td>
<td>Prolongs the refractory period and action potential duration</td>
</tr>
</tbody>
</table>
| INDICATIONS     | 1. Ventricular fibrillation  
2. Pulseless ventricular tachycardia  
3. Wide complex tachycardia with a pulse (with consultation) |
| CONTRAINDICATIONS | 1. Known hypersensitivity  
2. If lidocaine was previously used, **Do Not** use amiodarone  
3. Second / third degree AV blocks |
| SIDE EFFECTS    | 1. Hypotension  
2. Prolonged QT interval |
| SUPPLIED        | 150 mg / 3 ml vial  
VERIFY ACTUAL CONCENTRATION ON HAND BEFORE ADMINISTRATION |

### ADULT DOSAGE

**PULSELESS - Ventricular Fibrillation / Ventricular Tachycardia:**
300 mg IV Push  
(May be repeated one time at 150 mg IV push in 3 - 5 minutes if no change)

**PULSE PRODUCING - Wide Complex Tachycardia:**
150 mg diluted in 100 ml of D5 over 10 minutes  
*If pregnant use Lidocaine (Xylocaine)*

### PEDIATRIC DOSAGE

**PULSELESS - Ventricular Fibrillation / Ventricular Tachycardia:**
5 mg / kg IV / IO Push – May repeat up to 3 doses  
If the rhythm converts to a perfusing rhythm, then administer 2.5 mg / kg IV / IO mixed in 100 ml D5 over 20 - 60 minutes  
Max 300 mg

**PULSE PRODUCING - Wide Complex Tachycardia:**
2.5 mg / kg mixed in 100 ml D5 IV / IO over 20 - 60 minutes  
Max 150 mg

See PEDIATRIC DRUG ADMINISTRATION CHART for weight-based administration

<td>52-57 in</td>
</tr>
</tbody>
</table>

### KEY POINTS

- Amiodarone is the preferred antiarrhythmic medication to treat life threatening PULSELESS ventricular arrhythmias
- Avoid excessive movement and shaking of the medication
- Do not administer concurrently with other medications that prolong QT interval
- Ideally mixed in 100 ml bag of D5 for administration to patients with perfusing rhythms.
<table>

</table>
| **INDICATIONS**      | 1. Chest pain suggestive of a MI  
                        | 2. 12-Lead EKG indicating a possible MI  
                        | 3. Patients with Acute coronary symptoms |
| **CONTRAINdications**| 1. Known hypersensitivity  
                        | 2. Active ulcer disease  
                        | 3. Signs of stroke |
| **PRECAUTIONS**      | 1. GI bleeds |
| **SIDE EFFECTS**     | 1. Heartburn  
                        | 2. Nausea and vomiting |
| **SUPPLIED**         | 81 mg chewable tablet |
| **ADULT DOSAGE**     | **Acute Coronary Symptoms:**  
                        | 324 mg (4 tablets) |
| **PEDIATRIC DOSAGE** | Not recommended in the pre-hospital setting |
| **KEY POINTS**       | • If patient has already taken ASA in the last 24 hours, give ASA to equal 324 mg total |
**ATROPINE SULFATE**

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>C</th>
</tr>
</thead>
</table>
| ACTIONS          | 1. Blocks acetylcholine (parasympathetic nervous system)  
                   2. Increases conduction through the SA node by blocking vagal activity |
| INDICATIONS      | 1. Symptomatic sinus bradycardia  
                   2. Organophosphate poisoning  
                   3. Nerve agent exposure |
| CONTRAINDICATIONS| 1. Known hypersensitivity  
                     2. Second degree AV Blocks (Mobitz type II)  
                     3. Third degree AV Blocks |
| PRECAUTIONS      | 1. Avoid use in atrial flutter or atrial fibrillation with a rapid ventricular response  
                     2. May increase myocardial oxygen demand – use caution if possible acute MI  
                     3. May trigger tachydysrhythmias  
                     4. Avoid in hypothermic bradycardia |
| SIDE EFFECTS     | 1. Dry mouth  
                     2. Blurred vision  
                     3. Flushed skin  
                     4. Headache  
                     5. Tachycardia  
                     6. Pupillary dilation |
| SUPPLIED         | 1 mg / 10 ml |
| **ADULT DOSAGE** |   |
| Bradycardia:     | 1 mg IV / IO every 3 - 5 minutes  
                   (max dose 3 mg) |
| Organophosphate Poisoning: | 1 mg IV repeat every 3 - 5 minutes until resolution of symptoms  
                             *No max dose. Extremely large doses will likely be required* |
| **PEDIATRIC DOSAGE** |   |
| Bradycardia:     | 0.02 mg / kg IV / IO repeated in 5 minutes one time  
                   Minimum dose is 0.1 mg  
                   Max dose 0.5 mg  
                   EPINEPHrine is used first in peds bradycardia  
                   Useful in pediatrics only if evidence of vagal stimulation, use EPINEPHrine first in pediatric bradycardia |
| Organophosphate Poisoning: | 0.05 mg / kg IV Max 1 mg per dose  
                              Repeat every 3 - 5 minutes until resolution of symptoms.  
                              *No max dose. Extremely large doses will likely be required.* |

### MEDICATIONS

#### DEXTROSE 5%, 10%, 25%, AND 50%

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>C</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>ACTIONS</th>
<th>Restores blood sugar</th>
</tr>
</thead>
</table>

| INDICATIONS | 1. Treatment of altered mental status due to hypoglycemia  
2. Adult BGL less than 70 mg / dl or signs and symptoms of hypoglycemia  
3. Coma with associated hypoglycemia  
4. Delirium tremens with associated hypoglycemia  
5. Seizure or status epilepticus with associated hypoglycemia  
6. Cardiac arrest with associated hypoglycemia |
|------------|--------------------------------------------------|

| CONTRAINDICATIONS | 1. Known hyperglycemia  
2. Intracranial / intraspinal hemorrhage |
|-------------------|----------------------------------------|

| PRECAUTIONS | 1. Use with caution with stroke or head injury patients  
2. A blood glucose level should be determined prior to and post dextrose administration |
|-------------|--------------------------------------------------|

| SIDE EFFECTS | 1. Extravasation of Dextrose may cause necrosis  
2. Hyperglycemia |
|--------------|--------------------------------------------------|

| SUPPLIED | 5% IV bags 5 grams / 100 ml FOR MIXING DRIP MEDICATIONS ONLY  
10% IV bags 10 grams / 100 ml (250 ml = 25 g of dextrose)  
50% Prefilled syringes or vials containing 50 ml of Dextrose 50% (50 ml = 25 g of dextrose) |
|-----------|--------------------------------------------------|

| ADULT DOSAGE | Diabetic Emergencies / Hypoglycemia:  
If glucose < 40 / 25 g (250 ml of 10% or 50 ml of 50%)  
IV / IO - may repeat as required  
If glucose 40 – 70 / 12.5 g (125 ml of 10% or 25 ml of 50%)  
IV / IO - may repeat as required |
|-------------|--------------------------------------------------|

| PEDIATRIC DOSAGE | Diabetic Emergencies / Hypoglycemia:  
PEDIATRICS Dextrose 10% (D10)  
5 ml / kg IV / IO - may repeat as required  
PEDIATRICS MAKE Dextrose 25% (D25)  
Waste 25ml of D50 and replace with 25ml normal saline to create Dextrose 25% (D25)  
2 ml / kg IV / IO - may repeat as required  
NEONATE Dextrose 10% (D10)  
Dextrose 10% (D10)  
2 ml / kg IV / IO – may repeat as required  
NEONATE MAKE Dextrose 10% (D10) from 50%  
Waste 40 ml of D50 and replace with 40ml normal saline to make Dextrose 10% (D10)  
2 ml / kg IV / IO – may repeat as required |
|----------------|--------------------------------------------------|

See PEDIATRIC DRUG ADMINISTRATION CHART for weight-based administration

| Key Points | 5% Dextrose is used as a base solution for mixing specific drips in the field  
Dextrose should not be routinely given through IO, use other methods first. Use as a last resort in peri-arrest arrest patients only.  
Extravasation of Dextrose can cause tissue necrosis  
Attempt to use a large vein to administer Dextrose  
Precede Dextrose with Thiamine 100 mg IV / IM if the patient is suspected of chronic alcoholism or malnourishment (Adult patients) |
|-------------|--------------------------------------------------|

# MEDICATIONS

## diazePAM (Valium)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>D</th>
</tr>
</thead>
</table>

## ACTIONS

1. Sedative
2. Anticonvulsant
3. Amnestic (induces amnesia)

## INDICATIONS

1. Status epilepticus
2. Sedation prior to transcutaneous pacing, synchronized cardioversion, and painful procedures in the conscious patient
3. Cocaine induced acute coronary syndromes
4. Agitated or combative patients

## CONTRAINDICATIONS

1. Known hypersensitivity
2. Altered mental status of unknown origin
3. Head injury without seizure
4. Respiratory insufficiency

## PRECAUTIONS

1. May cause respiratory depression, respiratory effort must be continuously monitored with Capnography
2. Should be used with caution with hypotensive patients and patients with altered mental status
3. diazePAM (VALIUM) potentiates alcohol or other CNS depressants

## SIDE EFFECTS

1. Respiratory depression
2. Hypotension
3. Lightheadedness
4. Confusion
5. Slurred speech
6. Amnesia

## SUPPLIED

5 mg / ml

### ADULT DOSAGE

**Status Epilepticus:**
2.5 - 5 mg IV / IO may repeat to max dose 10 mg

**Procedural Sedation (Transcutaneous Pacing and Cardioversion):**
2.5 - 5 mg IV / IO

**Cocaine Induced ACS:**
2.5 - 5 mg IV / IO

**Airway Management:**
2.5 - 5 mg IV / IO

**Combative Psych Patient:**
2.5 - 5 mg IV / IO

### PEDIATRIC DOSAGE

**Status Epilepticus:**
0.2 mg / kg slow IV / IO max dose of 5mg
0.5 mg / kg rectal max dose of 10mg

**Procedural Sedation (Transcutaneous Pacing and Cardioversion):**
0.1 mg / kg slow IV / IO max dose of 5mg
0.5 mg / kg rectal max dose of 10mg

**Combative Psych Patient:**
0.1 mg / kg slow IV / IO max dose of 5mg
0.5 mg / kg rectal max dose of 10mg

## MEDICATIONS

### diphenhydramINE (Benadryl)

<table>
<thead>
<tr>
<th>ACTION CLASS</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIONS</td>
<td>Antihistamine</td>
</tr>
</tbody>
</table>
| INDICATIONS  | 1. Allergic reactions  
2. Adjunctive treatment to EPINEPHrine in anaphylaxis  
3. Medication induced extrapyramidal symptoms (EPS) |
| CONTRAINDICATIONS | 1. Known hypersensitivity  
2. Acute asthma |
| PRECAUTIONS  | 1. Carefully monitor patient while waiting for medication to take effect (effect of medication begins 15 minutes after administration)  
2. May cause CNS depression  
3. Use caution in patients with history of asthma  
4. Use caution in patients with history or cardiovascular disease |
| SIDE EFFECTS | 1. Sedation  
2. Dries secretions  
3. May exacerbate asthma  
4. Blurred vision  
5. Headache  
6. Hypotension  
7. Tachycardia  
8. Thickening of bronchial secretions |
| SUPPLIED     | 50mg / 1ml |

### ADULT DOSAGE

**Allergic Reaction or Anaphylactic Shock:**  
- Mild reaction - 25 – 50 mg slow IV / IO or IM  
- Moderate / Severe Reaction or Shock - 50 mg slow IV / IO or IM

**Extrapyramidal Symptoms:**  
- 25 mg – 50 mg IV / IM  
- DO NOT mix in the same syringe as Haloperidol (Haldol)

### PEDIATRIC DOSAGE

**Allergic Reaction or Anaphylactic Shock:**  
- 1 mg/kg slow IV / IO or IM  
- Max dose 50 mg

**Behavioral / Psychiatric Emergencies - Agitation**  
- 1 mg/kg slow IV / IO or IM  
- Max dose 50 mg

See PEDIATRIC DRUG ADMINISTRATION CHART for weight-based administration

### KEY POINTS

- Use in anaphylaxis only after EPINEPHrine (Adrenaline) and stabilization of cardiorespiratory symptoms
**EPINEPHrine (Adrenaline)**

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>C</th>
</tr>
</thead>
</table>
| ACTIONS | 1. Alpha and beta-adrenergic agonist  
2. Bronchodilation  
3. Increase heart rate and automaticity  
4. Increases cardiac contractility  
5. Increases myocardial conduction velocity  
6. Increases blood pressure |
| CONTRAINDICATIONS | Known hypersensitivity |
| PRECAUTIONS | Blood pressure, pulse, and ECG must be routinely monitored for all patients receiving EPINEPHrine |
| SIDE EFFECTS | 1. Palpitations  
2. Anxiety  
3. Headache  
4. Trembling  
5. Nausea / vomiting |
| SUPPLIED | 1 mg / 10 ml – 0.1 mg / ml (1:10,000)  
1 mg / 1ml (1:1000)  
Autoinjector Adult 0.3 mg EPINEPHrine >30kg (66 lbs)  
Autoinjector Jr. Peds 0.15 mg EPINEPHrine 15-30kg lbs (33-66) |

### ADULT DOSAGE

**Cardiac Arrest:**
1 mg of EPINEPHrine 100 mcg / ml (1:10,000) IV / IO every 3 - 5 minutes

**Anaphylactic Reaction:**
0.3 - 0.5 mg of EPINEPHrine 1mg / ml (1:1000) IM  
EMT MUST USE EPINEPHRINE AUTO-INJECTOR (0.3 mg) >30kg (66 lbs).

**Respiratory Distress – Stridor:**
5 mg of EPINEPHrine 1mg / ml (1:1000) Nebulized Undiluted Dose

**Respiratory Distress: (Unresponsive to Albuterol)**
0.3 - 0.5 mg of EPINEPHrine 1mg / ml (1:1000) IM

**Anaphylactic Shock: (Impending Arrest)**
1 ml per minute of EPINEPHrine 100 mcg / ml (1:10,000) IV / IO until resolution of blood pressure. Max dose 500 mcg (0.5 mg)

Cardiogenic, Neurogenic, Septic Shock, Post Resuscitation, Bradycardia – PUSH DOSE EPI  
Make 10 mcg / ml – 10 mcg (1 ml) every 2 - 5 mins - slow push titrate to effect  
To Maintain MAP > 65 or SBP 90 / Radial Pules if NBP Unavailable

### PEDIATRIC DOSAGE

**Cardiac Arrest:**
0.01 mg / kg of EPINEPHrine 0.1 mg / ml (1:10,000) - IV / IO every 3 - 5 minutes. Max 1mg per dose

**Anaphylactic Reaction:**
0.01 mg / kg of EPINEPHrine 1mg / ml (1:1000) IM - Max dose 0.5 mg  
EMT MUST USE EPINEPHRINE AUTO-INJECTOR JR (0.15 mg) 33 – 66 lbs.

**Croup: (If Racemic EPINEPHrine Not Available)**
<10 kg 3 ml of EPINEPHrine 1mg / ml (1:1000) nebulized  
>10 kg 5 ml of EPINEPHrine 1mg / ml (1:1000) nebulized

**Respiratory Distress: (Unresponsive to Albuterol)**
0.01 mg / kg of EPINEPHrine 1mg / ml (1:1000) IM - Max dose 0.5 mg

**Anaphylactic Shock: (Impending Arrest)**
0.01 mg / kg of 0.1 mg / ml (1:10,000) IV / IO until resolution of blood pressure – Max dose 0.5 mg

Cardiogenic, Neurogenic, Septic Shock, Post Resuscitation – PUSH DOSE EPI  
Make 10 mcg / ml – 10 mcg / kg every 2-5 mins – Max dose 10 mcg / slow push titrate to effect

See PEDIATRIC DRUG ADMINISTRATION CHART for weight-based administration

</tr>
</tbody>
</table>

**KEY POINTS**

- Do Not Confuse Epi 1 mg / ml (1:1000) IM and 0.1 mg / ml (100 mcg / ml (1:10,000) IV

**PUSH DOSE EPI PREPARATION**

Mix 1 mg EPINEPHrine (Adrenaline) of 1mg / ml (1:1000) in 100 ml of DS or Normal Saline  
*This makes 10 mcg / ml concentration*

Shake bag well to mix  
Draw from bag and administer

**PUSH DOSE EPI KEY POINTS**

- Label the IV bag once mixed to prevent misuse  
- Use filter needle when drawing from ampoules, discard filter needle and use fresh while injecting
### MEDICATIONS

**fentaNYL (Sublimaze)**

#### KEY POINTS

- Likelihood of side effects increases with rapid administration
- Narcotic naive patients may need lower dosing regiment
- Preferred analgesic for trauma / ACS
- Must be given slowly IV
## MEDICATIONS

### GLUCAGON (Glucagen)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>B</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIONS</td>
<td>1. Causes breakdown of glycogen to glucose increasing blood glucose level</td>
</tr>
<tr>
<td>INDICATIONS</td>
<td>1. Correction of hypoglycemia when vascular access is not able to be established and oral glucose is contraindicated</td>
</tr>
<tr>
<td>CONTRAINDICATIONS</td>
<td>Known hypersensitivity</td>
</tr>
</tbody>
</table>
| PRECAUTIONS | 1. Glucagon is only effective in patients with enough stores of glycogen (glycogen stored in liver)  
2. Glucagon can be administered on scene, but do not wait for it to take affect |
| SIDE EFFECTS | 1. Nausea and vomiting  
2. Hyperglycemia |
| SUPPLIED | Vials of 1mg Glucagon with 1ml of diluting solution |
| ADULT DOSAGE | Hypoglycemia without Vascular Access:  
1 mg IM |
| PEDIATRIC DOSAGE | Hypoglycemia Without Vascular Access:  
0.5 mg IM < 20kg  
1 mg IM > 20kg |
| KEY POINTS | • Response is usually noticed in 5 - 20 minutes. If response is delayed, dose may be repeated  
• If IV is established after Glucagon (Glucagen) is given and patient is still hypoglycemic, administer Dextrose |
# MEDICATIONS

## HALOPERIDOL (Haldol)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIONS</td>
<td>Chemical restraint of acute psychosis or agitation patients</td>
</tr>
<tr>
<td>INDICATIONS</td>
<td>Aggressive, violent, or severely agitated patients in the setting of psychosis or alcohol intoxication</td>
</tr>
</tbody>
</table>
| CONTRAINDICATIONS | 1. *Not for use in combative or violent reactions resulting from treatable medical emergencies Such As Hypoxemia, Sepsis, Seizure, Encephalitis, Hypoglycemia or Stroke.*  
  2. Dementia related psychosis  
  3. Known hypersensitivity  
  4. Parkinson’s disease  
  5. CNS depression  
  6. Severe cardiac disease  
  7. Hepatic disease |
| PRECAUTIONS     | 1. Elderly patients  
  2. Prolonged QT interval on EKG  
  3. Renal patients  
  4. Respiratory diseases  
  5. Seizure disorders |
| SIDE EFFECTS    | 1. Sedation  
  2. Extrapyramidal symptoms (EPS) / dystonic reactions  
  3. Orthostatic Hypotension |
| SUPPLIED        | 5 mg / 1 ml |
| ADULT DOSAGE    | **Combative Psych Patient:**  
  5 mg IM ONLY  
  Over age 65; 2.5 mg IM ONLY  
  **Alcohol Related Emergencies**  
  5 mg IM ONLY  
  Over age 65; 2.5 mg IM ONLY |
| PEDIATRIC DOSAGE| Not Indicated in the pre-hospital setting |
| KEY POINTS      | • If administration causes extrapyramidal symptoms (EPS) give diphenhydrAMINE (Benadryl) 25 mg – 50 mg IV / IM  
  • EPS symptoms are: Involuntary purposeless movements of body, usually of the face such as grimacing, tongue protrusion, lip smacking, lip puckering, or eye blinking.  
  • DO NOT mix Haloperidol (Haldol) and diphenhydrAMINE (Benadryl) in the same syringe. |

|                  | 7. Increased Cardiac Output  
|                  | 8. Myocardial Depression |
| SUPPLIED         | 500 mg / 5 ml (100 mg / ml) or 100 mg / 10ml (10mg / ml)  
|                  | VERIFY ACTUAL CONCENTRATION ON HAND BEFORE ADMINISTRATION  
|                  | Creation of 10 mg / ml concentration from 100 mg / ml concentration -  
|                  | Use 10 ml syringe with 9 ml of saline and then draw 1 ml of 100 mg / ml and mix in syringe - Yield is 10 mg / ml – Overdraw air in syringe while mixing to assure proper dilution |
| ADULT DOSAGE     | Adult Advanced Airway Placement:  
|                  | 1 - 2 mg / kg IV / IO  
|                  | Induction for RSI (For Departments Who Provide RSI)  
|                  | 1 - 2 mg / kg IV / IO  
|                  | Violent Psych / Excited Delirium / Acute Psychosis  
|                  | 250 mg IM of the 100mg/ml concentration (2.5 ml),  
|                  | May repeat 250 IM in 5 mins if no response  
|                  | Pain Management – MUST USE 10 mg / ml Concentration – See Above  
|                  | 10 mg IV / IO / IM / IN  
|                  | May repeat every 5 min – max 30 mg |
| PEDIATRIC DOSAGE | Violent Psych / Excited Delirium / Acute Psychosis:  
|                  | 16 Years or older AND over 50kg  
|                  | 2 mg / kg IM  
|                  | May repeat 1 mg / kg in 5 minutes if no response  
|                  | Max Per dose 250 mg |
| KEY POINTS       | • To prevent emergence reactions (Confusion, excitement, irrational behavior, hallucinations) after administration of Ketamine (Ketalar), administer a Benzodiazepine such as LORazepam (Ativan) or Midazolam (Versed)  
|                  | • If dissociative doses (any dosing other than pain dosing) of Ketamine (Ketalar) given, make sure verbal hand off is with the receiving Physician and includes this information so patient presentation is not confused with other medical etiology.  
|                  | • Blood pressure may elevate after injection but usually returns to pre-administration values within 15 mins.  
|                  | • Ketamine use in pregnancy is a risk / benefit assessment per case. Consult Medical Direction if there are questions |

</table>
| ACTIONS         | 1. Non-Steroidal Anti-Inflammatory Analgesic  
2. Antipyretic |
| INDICATIONS     | 1. Kidney stones / Flank pain  
2. Moderate pain |
| CONTRAINDICATIONS | 1. Known hypersensitivity to NSAIDS / Aspirin  
2. >65 years old  
3. Bleeding (GI, Cerebrovascular)  
4. Obvious pregnancy / nursing mothers  
5. Asthmatics with sensitivity to NSAIDS |
| SIDE EFFECTS    | 1. Edema  
2. Hypertension  
3. Rash  
4. Nausea  
5. Dizziness |
| SUPPLIED        | 30 mg / 1 ml |

### ADULT DOSAGE

**Moderate Pain / Kidney Stones:**
- 15 mg IV / IO
- 30 mg IM

### PEDIATRIC DOSAGE

Not recommended in the pre-hospital setting

|                   | 5. Sick sinus syndrome  
|                   | 6. Heart failure |
| **PRECAUTIONS**   | 1. Asthma / bronchospastic diseases  
|                   | 2. Impaired liver functions  
|                   | 3. Elderly  
|                   | 4. Thyroid disorders  
|                   | 5. Hypotension may occur  
|                   | 6. Conduction disturbances in cardiac conduction may occur |
| **SIDE EFFECTS**  | 1. Hypotension  
|                   | 2. Bradycardia  
|                   | 3. Dizziness  
|                   | 4. Fatigue  
|                   | 5. Arrhythmias |
| **SUPPLIED**      | 20 mg / 4 ml vial or Carpuject or 100 mg / 20ml - vial |

| **ADULT DOSAGE**  | **Pre-Eclampsia, Eclampsia, or Post-partum Hypertension**  
|                   | If SBP >160 and / or DBP 110 with symptoms  
|                   | 20 mg IV slow – if no improvement in 5 min then  
|                   | 40 mg IV slow  
|                   | **Stroke with hypertension – WHERE PARTICIPATING**  
|                   | If SBP > 220 or DBP > 120 verified by 2 readings, in 2 locations, 1 manual  
|                   | 10 mg IV slow – if no improvement in 10 min then;  
|                   | 20 mg IV slow |

| **PEDIATRIC DOSAGE** | Not Indicated in the pre-hospital setting |
| **KEY POINTS**       | • Check blood pressures in both arms, with at least one BP being a manual BP  
|                     | • Monitor cardiac and pulmonary status during administration |
### MEDICATIONS

#### LIDOCAINE (Xylocaine)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>B</th>
</tr>
</thead>
</table>
| ACTIONS          | 1. Anesthetizes the intrasosseous space during fluid administration to increase pain tolerance  
2. Suppresses ventricular ectopy |
| INDICATIONS      | 1. Anesthetization of intrasosseous space prior to or during IO administration of fluids  
2. Antiarrhythmic for ventricular arrhythmias in the absence of Amiodarone (Cordarone)  
3. Antiarrhythmic for ventricular arrhythmias in place of Amiodarone (Cordarone) for pregnant patients |
| CONTRAINDICATIONS| 1. Known hypersensitivity to Lidocaine (Xylocaine) or caine family  
2. AV blocks  
3. Idioventricular escape rhythms  
4. Accelerated idioventricular rhythm  
5. Sinus bradycardia or arrest or block  
6. Hypotension  
7. Shock |
| SIDE EFFECTS     | 1. Dizziness  
2. Numbness  
3. Drowsiness  
4. Confusion  
5. Seizure  
6. Respiratory depression |
| PRECAUTIONS      | 1. Do NOT use Lidocaine (Xylocaine) if Amiodarone (Cordarone) already used  
2. Use half dose if patient is over 70 years old or has a history of liver failure or CHF |
| SUPPLIED         | 100 mg / 5 ml |

#### ADULT DOSAGE

**Anesthetization of Intrasosseous Space:**

- Up to 40 mg IO push - slow to allow Anesthetization of the IO space

**Ventricular Fibrillation or Ventricular Tachycardia without a Pulse**

1. 1 - 1.5 mg / kg IV / IO First Dose
2. 0.5 - 0.75 mg / kg IV / IO Second Dose if needed (max dose 3 mg / kg)
   - If Conversion to a non-bradycardic perfusing rhythm occurs, then start Lidocaine (Xylocaine) drip at 2 - 4 mg / min

**Wide Complex Tachycardia with a Pulse**

1. 1 - 1.5 mg / kg IV / IO First Dose
2. 0.5 - 0.75 mg / kg IV / IO Second Dose if needed (max dose 3 mg / kg)
   - If Conversion to a non-bradycardic perfusing rhythm occurs, then start Lidocaine (Xylocaine) drip at 2 - 4 mg / min

#### PEDIATRIC DOSAGE

**Anesthetization of Intrasosseous Space:**

- 0.5 mg / kg IO push - slow to allow Anesthetization of the IO space
  - Max 40 mg

**Ventricular Fibrillation or Ventricular Tachycardia without a Pulse**

1. 1 mg / kg IV / IO First Dose
2. 0.5 mg / kg IV / IO Second Dose if needed (max dose 3 mg / kg)
   - If Conversion to a non-bradycardic perfusing rhythm occurs, then use Lidocaine (Xylocaine) give 0.5 mg / kg IV / IO every 10 mins to maintain x 2.

**Ventricular Fibrillation or Ventricular Tachycardia with a Pulse**

1. 1 mg / kg IV / IO First Dose
2. 0.5 mg / kg IV / IO Second Dose if needed (max dose 3 mg / kg)
   - If Conversion to a non-bradycardic perfusing rhythm occurs, then use Lidocaine (Xylocaine) give 0.5 mg / kg IV / IO every 10 mins to maintain x 2.

# LORazepam (Ativan)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>D</th>
</tr>
</thead>
</table>
| ACTIONS         | 1. Sedative  
|                 | 2. Anticonvulsant  
|                 | 3. Amnestic (induces amnesia) |
| INDICATIONS     | 1. Status epilepticus  
|                 | 2. Sedation prior to transcutaneous pacing, synchronized cardioversion, and painful procedures in the conscious patient  
|                 | 3. Cocaine induced acute coronary syndromes  
|                 | 4. Agitated or combative patients |
| CONTRAINDICATIONS | 1. Known hypersensitivity  
|                 | 2. Altered mental status of unknown origin  
|                 | 3. Head injury without seizure  
|                 | 4. Respiratory insufficiency |
| PRECAUTIONS     | 1. May cause respiratory depression, respiratory effort must be continuously monitored with Capnography  
|                 | 2. Should be used with caution with hypotensive patients and patients with altered mental status  
|                 | 3. LORazepam (Ativan) potentiates alcohol or other CNS depressants |
| SIDE EFFECTS    | 1. Respiratory depression  
|                 | 2. Hypotension  
|                 | 3. Lightheadedness  
|                 | 4. Confusion  
|                 | 5. Slurred speech  
|                 | 6. Amnesia |
| SUPPLIED        | 2 mg / 1 ml |

## ADULT DOSAGE

| Status Epilepticus: | 1 – 2 mg IM / IV / IO / IN per dose (max dose 4 mg) |
| Half dose > 65 / Liver disease | May repeat in 5 - 10 minutes, if seizure persists and patient SBP is > 90 mmHg |
| Procedural Sedation (Transcutaneous Pacing and Cardioversion): | 1 – 2 mg IM / IV / IO / IN (max dose 2 mg) |
| Cocaine Induced ACS: | 1 – 2 mg IM / IV / IO / IN (max dose 2 mg) |
| Airway Management: | 1 – 2 mg IM / IV / IO / IN (max dose 2 mg) |
| Combative Psych Patient: | 1 – 2 mg IM / IV / IO / IN (max dose 2 mg) |
| Alcohol Related Emergencies – Combative / Withdrawal: | 1 – 2 mg IM / IV / IO / IN (max dose 2 mg) |

## PEDIATRIC DOSAGE

| Status Epilepticus: | 0.05 – 0.1 mg / kg slow IM / IV / IO / IN (max dose 2 mg) |
| Procedural Sedation (Transcutaneous Pacing and Cardioversion): | 0.05 mg / kg slow IM / IV / IO / IN (max dose 2 mg) |
| Combative Psych Patient: | 0.05 – 0.1 mg / kg slow IM / IV / IO / IN (max dose 2 mg) |

MAGNESIUM SULFATE

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>A</th>
</tr>
</thead>
</table>
| ACTIONS         | 1. Central Nervous System Depressant  
2. Anticonvulsant  
3. Antiarrhythmic  
4. Bronchodilation |
| INDICATIONS     | 1. Ventricular fibrillation / pulseless ventricular tachycardia in patients who are malnourished or chronic alcoholics  
2. Treatment of seizures in eclampsia patients  
3. Torsades de pointes  
4. Asthma / COPD refractory to sympathomimetic |
| CONTRAINDICATIONS | 1. Known hypersensitivity  
2. Shock  
3. Heart blocks |
| PRECAUTIONS     | 1. Hypotension  
2. Renal impairment |
| SIDE EFFECTS    | 1. Respiratory depression  
2. Flushing  
3. Drowsiness |
| SUPPLIED        | 2 grams / 100 ml or 1 gram / 2 ml vial 50% solution or 2 grams / 50 ml |

VERIFY ACTUAL CONCENTRATION ON HAND BEFORE ADMINISTRATION

| ADULT DOSAGE | Cardiac Arrest / Torsades or Hypomagnesemia:  
1 - 2 g IV / IO  
Torsades with Pulse:  
1 - 2 g IV / IO  
Eclampsia:  
4 - 6 g IV / IO over 2 - 4 minutes  
Pre-Eclampsia / Post-Partum Hypertension:  
4 - 6 g IV / IO over 20 – 60 minutes  
Respiratory Distress / Bronchoconstriction with minimal relief from sympathomimetics  
2 Grams IV / IO over 20 – 60 minutes |

| PEDIATRIC DOSAGE | Not recommended in the pre-hospital setting |
| KEY POINTS       | • Check deep tendon reflexes (DTR’s) after administration (if trained)  
• Monitor EKG, vital signs, and respiratory effort during administration |
### MEDICATIONS

| methylPREDNISolone (SOLU-medrol) |

| PREGNANCY CLASS | C |
| ACTIONS | 1. Reduces inflammation in lower airways |
| INDICATIONS | 1. Anaphylaxis  
2. Asthma  
3. COPD  
4. Croup  
5. Stridor  
6. Pediatric Sepsis  
7. Addisonian / Adrenal crisis when no better agent available |
| CONTRAINDICATIONS | None in the emergency setting |
| PRECAUTIONS | 1. Use with caution in diabetics, hyperglycemia  
2. Use with caution in recent MI |
| SIDE EFFECTS | 1. Hyperglycemia  
2. Increased susceptibility to infection  
3. GI bleeding |
| SUPPLIED | 125 mg / 2 ml Act-o-Vial |

#### ADULT DOSAGE

| Anaphylaxis: | 125 mg IV / IO  
Respiratory Distress / Asthma / COPD / Stridor: | 125 mg IV / IO |

#### PEDIATRIC DOSAGE

| Anaphylaxis: | 2 mg / kg IV (max dose 125 mg)  
Pediatric Upper Airway (Stridor / Croup): | 2 mg / kg IV (max dose 125 mg)  
Pediatric Lower Airway (Wheezing): | 2 mg / kg IV (max dose 125 mg)  
Pediatric Sepsis: | 2 mg / kg IV (max dose 125 mg) |

#### KEY POINTS

- methylPREDNISolone (SOLU-medrol) will need to be mixed just prior to administration. Fluid will initially be cloudy, but will change quickly to clear.
- Can be given IM if no vascular access, but not ideal.
- Be cautious with pediatric dosing, as the amounts may be very small. Use a 1 ml syringe for accuracy.

**VERIFIED ACTUAL CONCENTRATION ON HAND BEFORE ADMINISTRATION**

### ADULT DOSAGE

**Status Epilepticus – With Vascular Access:**
- 2.5 mg IV - Max 5 mg

**Status Epilepticus – Without Vascular Access:**
- 5 mg IM / IN Atomized – (1/2 dose up each nostril – 1 ml total for each nostril) Max 10 mg

**Procedural Sedation (Cardioversion, Pacing) With Vascular Access:**
- 2.5 mg IV (1 minute prior to procedure) Max 5 mg

**Procedural Sedation (Cardioversion, Pacing) No Vascular Access:**
- 5 mg IM / IN Atomized – (1/2 dose up each nostril – 1 ml total for each nostril) Max 10 mg

**Airway Management – With Vascular Access:**
- 2.5 mg IV (1 minute prior to procedure) Max 5 mg

**Airway Management – No Vascular Access:**
- 5 mg IM / IN Atomized – (1/2 dose up each nostril – 1 ml total for each nostril) Max 10 mg

**Alcohol Related Emergencies – Combative / Withdrawal – With Vascular Access:**
- 2.5 mg IV (1 minute prior to procedure) Max 5 mg

**Alcohol Related Emergencies – Combative / Withdrawal – No Vascular Access:**
- 5 mg IM / IN Atomized – (1/2 dose up each nostril – 1 ml total for each nostril) Max 10 mg

**Combative Psych Patient – With Vascular Access:**
- 2.5 mg IV (1 minute prior to procedure) Max 5 mg

**Combative Psych Patient – NO Vascular Access:**
- 5 mg IM / IN Atomized – (1/2 dose up each nostril – 1 ml total for each nostril) Max 10 mg

**Cocaine Induced ACS – With Vascular Access:**
- 2.5 mg IV (1 minute prior to procedure) Max 5 mg

**Cocaine Induced ACS – NO Vascular Access:**
- 5 mg IM / IN Atomized – (1/2 dose up each nostril – 1 ml total for each nostril) Max 10 mg

### PEDIATRIC DOSAGE

**Status Epilepticus – With Vascular Access:**
- 0.1 mg / kg IV / IO max dose 2.5 mg

**Status Epilepticus – NO Vascular Access:**
- 0.2 mg / kg IN / IM – (1/2 dose up each nostril) Max Dose 5 mg

**Procedural Sedation (Cardioversion, Pacing) With Vascular Access:**
- 0.1 mg / kg IV / IO max dose 2.5 mg

**Procedural Sedation (Cardioversion, Pacing) No Vascular Access:**
- 0.2 mg / kg IN / IM – (1/2 dose up each nostril) Max Dose 5 mg

**Combative Psych Patient – With Vascular Access:**
- 0.1 mg / kg IV / IO – Max Dose 2.5 mg

**Combative Psych Patient – NO Vascular Access:**
- 0.2 mg / kg IN / IM– (1/2 dose up each nostril) Max Dose 5 mg

# NITROGLYCERIN (Nitro-Stat)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>C</th>
</tr>
</thead>
</table>

| ACTIONS          | 1. Vasodilatation  
|                  | 2. Coronary artery dilation  
|                  | 3. Decreases myocardial oxygen demand  
|                  | 4. Decreases vascular resistance |

| INDICATIONS      | 1. Suspected ischemic chest pain / AMI  
|                  | 2. Hypertensive emergency with signs and symptoms of ACS  
|                  | 3. Pulmonary edema |

| CONTRAINDICATIONS| 1. Hypotension  
|                 | 2. Known hypersensitivity  
|                 | 3. Use of Viagra or similar erectile dysfunction or pulmonary hypertension medications within 48 hours |

| PRECAUTIONS      | 1. Use caution in patients with inferior wall MI or right ventricular involvement (Elevation in leads II, III, AVF or V4R)  
|                  | 2. Avoid use in patients with increased intracranial pressure or glaucoma  
|                  | 3. If the patient becomes hypotensive after nitroglycerine administration, then place the patient in a semi-reclined position with legs elevated and give IV normal saline bolus |

| SIDE EFFECTS     | 1. Hypotension  
|                  | 2. Throbbing headache  
|                  | 3. Lightheadedness / dizziness  
|                  | 4. Syncope |

| SUPPLIED         | 0.4 mg SL tablet or 400mcg SL powder (GoNitro) |

| ADULT DOSAGE     | Cardiac Chest Discomfort / AMI:  
|                  | 0.4 mg (400 mcg) SL (may be repeated up to 3 doses total) |

- **EMT CONTACT ONLINE MEDICAL CONTROL**

| Pulmonary Edema / CHF:  
| 0.4 mg (400 mcg) SL (may be repeated up to 3 doses total) |

| PEDIATRIC DOSAGE   | Not recommended in prehospital setting |

| KEY POINTS         | • May repeat up to 3 doses if B/P systolic > 110 with IV or 120 without IV  
|                    | • Assure that patient does not chew or swallow tablets |

</thead>
</table>

| **KEY POINTS** | • Remove from foil blister by peeling back (do not push tablet through the foil)  
• Place tablet in mouth immediately upon removal  
• Tablet dissolves rapidly in saliva and may be swallowed with or without liquid  
• If administration causes extrapyramidal symptoms (EPS) give diphenhydRAMINE (Benadryl) 25 mg – 50 mg IV / IM  
• EPS symptoms are: Involuntary purposeless movements of body, usually of the face such as grimacing, tongue protrusion, lip smacking, lip puckering, or eye blinking.  
• Do not co-administer with benzodiazepines. |
|-----------------|------------------------------------------------|--|
## ONDANSETRON (Zofran)

**PREGNANCY CLASS**  
B  

### ACTIONS  
1. Prevents nausea and vomiting by blocking serotonin peripherally and centrally in the small intestines  

### INDICATIONS  
1. Nausea and vomiting  
2. Chemotherapy and radiation induced nausea and vomiting  

### CONTRAINDICATIONS  
1. Known hypersensitivity  
2. Severe liver disease  

### PRECAUTIONS  
1. Pregnancy  
2. May prolong QT interval when used with another QT prolonging agent  

### SIDE EFFECTS  
1. Constipation, diarrhea  
2. Increased liver enzymes  
3. Headache  
4. Fatigue and malaise  

### SUPPLIED  
4 mg / 2 ml single dose vial and 4 mg oral disintegrating tablets (ODT)  

### ADULT DOSAGE  
**Anti-Emetic**  
4 mg IM or IV  
May repeat in 15 minutes if symptoms unresolved  

**Anti-Emetic ODT**  
4 mg Oral disintegrating tablets (ODT) may repeat up to 8 mg max  

### PEDIATRIC DOSAGE  
**Anti-Emetic**  
0.15 mg / kg IM or IV -or- 0.15 mg / kg PO (injectable liquid) > 1 year old  
Max 4 mg  

**Anti-Emetic ODT**  
if > 40 kg / 12 Years, then 4 mg Oral disintegrating tablets (ODT)  

See PEDIATRIC DRUG ADMINISTRATION CHART for weight-based administration

| **CONTRAINdications** | 1. Known hypersensitivity to corn products  
|                     | 2. Unconscious patients |
| **PRECAUTIONS**     | 1. Patient must be alert and able to sufficiently swallow  
|                     | 2. Monitor patient for difficulty swallowing or choking due to the thick consistency of agent |
| **SUPPLIED**        | Squeeze tube containing 24 grams of flavored oral dextrose gel |
| **ADULT DOSAGE**    | One complete tube (15 g – 37.5 g) by mouth |
| **PEDIATRIC DOSAGE**| Half a tube by mouth (7.5-18.75 g – Approximately) by mouth |
| **KEY POINTS**      | The patient must be alert and can swallow! |
### MEDICATIONS

#### OXYGEN (O$_2$)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>B</th>
</tr>
</thead>
</table>
| **ACTIONS**     | 1. Increases oxygen content of blood  
|                 | 2. Improves tissue oxygenation  
|                 | 3. Decreases energy expended for respirations |
| **INDICATIONS** | 1. Cardiac chest discomfort / ACS with spo2 < 94  
|                 | 2. Suspected stroke  
|                 | 3. Hypoxemia  
|                 | 4. Cardiopulmonary emergencies  
|                 | 5. Trauma  
|                 | 6. Shortness of breath / dyspnea  
|                 | 7. Sedative drug administration  
|                 | 8. Unknown oxyhemoglobin saturation |
| **CONTRAINDICATIONS** | None in the prehospital setting |
| **PRECAUTIONS** | Be aware for respiratory depression in COPD patients on prolonged high flow oxygen |
| **SIDE EFFECTS** | High concentrations of oxygen may reduce the respiratory drive in some COPD patients; these patients should be carefully monitored |
| **SUPPLIED**    | As a compressed gas in cylinders of varying sizes |
| **ADULT DOSAGE** | 12 - 15 lpm via NRB mask or 2 - 6 lpm via nasal cannula, 6 - 8 lpm via small volume nebulizer, unless otherwise indicated |
| **PEDIATRIC DOSAGE** | 12 - 15 lpm via NRB mask or 2 - 6 lpm via nasal cannula, or 6 - 8 lpm via unit dose nebulizer, unless otherwise indicated |
| **KEY POINTS**  | • Never withhold oxygen to those who need it  
|                 | • All sedative medication administration must have oxygen administration |

| INDICATIONS     | - Adult > 16 years old  
                          - Evidence of current or previous uncontrolled hemorrhage  
                          - Hemorrhagic shock from recent Trauma (< 1 hour)  
                          - Sustained tachycardia (>120 bpm) and / or hypotension (systolic < 90mmHg)  
                          - TXA must be given within 60 minutes from time of injury  
                          - Post-partum hemorrhage with signs of shock |
| CONTRAINDICATIONS | - Hypersensitivity to medication  
                                 - Suspected CVA, MI, or PE |
| PRECAUTIONS     | - TXA should not be administered in non-hemorrhagic shock.  
                          - TXA should only be administered within 60 minutes of the injury |
| SIDE EFFECTS    | - Anaphylaxis  
                          - Thrombosis  
                          - Hypotension (with rapid infusion, such as rate of greater than 100 mg/min)  
                          - Nausea, vomiting, diarrhea  
                          - Visual disturbances (blurred vision, changes in color vision) |
| SUPPLIED        | 1 Gram / 10 ml Vial or Ampule |

**ADULT DOSAGE**

- **Adult Trauma with Uncontrolled Bleeding and Hemodynamic Instability**
  - Mix 1gm in 100 ml of D5 and administer over 10 minutes  
    - 10 drops / ml drip set (2qtt/sec)  
    - 15 drops / ml drip set (3gtts/sec)

- **Post-Partum Hemorrhage**
  - Mix 1gm in 100 ml of D5 and administer over 10 minutes  
    - 10 drops / ml drip set (2qtt/sec)  
    - 15 drops / ml drip set (3gtts/sec)

# Duo-Dote (Atropine and Pralidoxime Chloride)

## VALIUM Auto Injector

### Pregnancy Class

| C |

### Actions

**DuoDote**
- Blocks nerve agents effects and relieves airway constriction and secretions in the lungs and gastrointestinal tract.
- Acts to restore normal functions at the nerve ending by removing the nerve agent and reactivating natural function

**Valium:**
- Given to treat seizures caused by exposure to nerve agents (buddy treatment) – SUPPLEMENT TO DUODOTE

### Indications

Suspected or confirmed nerve agent exposure

### Contraindications

Both medications in the kit should be used with caution (but not withheld) in patients with preexisting cardiac disease, HTN, or CVA history

### Precautions

- Chest pain
- Exacerbation of angina
- Myocardial infarction
- Blurred vision
- Headache
- Drowsiness
- Nausea
- Tachycardia
- Hypertension
- Hyperventilation

### Supplied

DUODOTE - Each auto injector contains BOTH: Atropine 2.1 mg and Pralidoxime 600 mg
Valium auto injector contains 10 mg

### Adult Dosage

For Nerve Agent Exposure (SLUDGE symptoms):
Up to 3 auto injectors may be used for one patient based on signs (1 - 2 kits for self-treatment - up to 3 for buddy treatment with severe symptoms)

For Seizures Associated with Nerve Agent Exposure:
1 Valium auto injector (buddy administration)

### Pediatric Dosage

DuoDotes are not authorized for the use of children under 41 kg (
### ETOMIDATE (Amidate)

Special Use Medications

Only for Cyanide Exposure Response – Where available

Hydroxocobalamin (Cyanokit)

<table>
<thead>
<tr>
<th>PREGNANCY CLASS</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIONS</td>
<td>Cyanide antidote – binds to cyanide ions for excretion</td>
</tr>
</tbody>
</table>
| INDICATIONS     | Known or suspected cyanide poisoning with  
|                 | 1. Cardiac or Respiratory Arrest  
|                 | 2. Seizures  
|                 | 3. Hypotension (MAP < 65)  
|                 | 4. Confusion or disorientation with one of the above |
| CONTRAINDICATIONS | None in the emergency setting – assure airway, breathing, and circulatory support are in place prior to administration. |
| PRECAUTIONS     | 1. Use caution if other cyanide antidotes are used simultaneously with Hydroxocobalamin (Cyanokit), use separate IV lines  
|                 | 2. Do not use if there is particulate matter in the vial after reconstitution or the solution is not dark red |
| SIDE EFFECTS    | 1. Possible allergic reaction  
|                 | 2. Eye irritation, redness, swelling  
|                 | 3. Abdominal pain, nausea, vomiting, diarrhea  
|                 | 4. Chest discomfort  
|                 | 5. Dizziness, restlessness  
|                 | 6. Dyspnea, tight throat  
|                 | 7. Skin flushing, urticaria |
| SUPPLIED        | (1) 5 g vials for reconstitution – rock and invert for 30 seconds per vial |
| ADULT DOSAGE    | Cyanide Exposure:  
|                 | 5 g over 15 minutes |
| KEY POINTS      | • A second dose of 5 g may be considered depending on patient response and severity of exposure.  
|                 | • Discard unused medication after 6 hours  
|                 | • Reconstitute with normal saline (0.9% sodium chloride)  
|                 | • May have drug interactions, administer all other medications via a separate IV line |

Complete Starting Dose: 5 g

1. Reconstitute: Place the vial in an upright position. Add 200 mL of 0.9% Sodium Chloride injection* to the vial using the transfer spike. Fill to the line.
   
   *0.9% Sodium Chloride injection is the recommended diluent (diluent not included in the kit). Lactated Ringers injection and 5% Dextrose injection have also been found to be compatible with hydroxocobalamin and may be used if 0.9% Sodium Chloride is not readily available

2. Mix: The vial should be repeatedly inverted or rocked, not shaken, for at least 60 seconds prior to infusion.
   
   • CYANOKIT solutions should be visually inspected for particulate matter and color prior to administration – Discard solution if particulate matter is present or solution is not dark red

3. Infuse Vial: Use vented intravenous tubing, hang and infuse over 15 minutes.

---

**INSTRUCTIONS:**

1. **WITHDRAY** 10 ml of Sterile Water for Injection, USP, using the 10 ml, BD™ Syringe with BD Tween™15 Plunger included in the kit. See TNKase Package Insert for instructions on use of the dual cannula device.

2. **INJECT** entire contents into the TNKase vial, directing the needle at the powder. Slight foaming upon reconstitution is not uncommon. Use stand undisturbed for several minutes to allow bubbles to dissipate.

3. **GENTLY SWIRL** until contents are completely dissolved. DO NOT SHAKE. Solution should be colorless or pale yellow and transparent. USE UPON RECONSTITUTION. IF NOT USED IMMEDIATELY, REFRIGERATE AT 2 TO 8°C (36-46°F) AND USE WITHIN 8 HOURS. DO NOT FREEZE.

4. **WITHDRAW** the appropriate volume of solution based on patient weight. (See package insert for dose recommendations) i.e., 10 mg/kg in an intravenous [IV] line containing dextrose.

5. **FLUSH** a dextrose-containing solution with a saline-containing solution prior to and following administration (precipitation may occur when TNKase is administered in an intravenous [IV] line containing dextrose).

6. **ADMINISTER** as an IV BOLUS over 5 seconds.

</table>
The devices and equipment illustrated in this section represent devices commonly in use in the region at the time of this writing. Inclusion of any item in this document does not represent any specific endorsement by any regional Hospital or system.

The individual Medical Director and the supported EMS agency have the right to choose which equipment and devices fit their needs. It is incumbent upon the Medical Director and the supported EMS agency to provide all required training for devices and equipment provided or utilized.
INDICATIONS

- Any MEDICAL patient 18 years or older, any TRAUMA patient 16 years or older.

PROCEDURE

1. Scene size-up, including universal precautions, scene safety, environmental hazards assessment, need for additional resources, by-stander safety, and patient / caregiver interaction.
2. Assess need for additional resources.
3. Initial assessment includes a general impression as well as the status of a patient’s airway, breathing, and circulation.
4. Assess mental status (e.g., AVPU) and disability (e.g., GCS).
5. Control major hemorrhage and assess overall priority of patient.
6. Perform a focused history and physical based on patient’s chief complaint.
7. Assess need for critical interventions.
8. Complete critical interventions and perform a complete secondary exam to include a baseline set of vital signs as directed by protocol.
9. Maintain an on-going assessment throughout transport, to include patient response / possible complications of interventions, need for additional interventions, and assessment of evolving patient complaints / conditions.

KEY POINTS

Dealing with the family:

- **REMAIN CALM.** Show efficiency and competence, even if you do not really feel it.
- Show a caring a concerned manner for both the family and the patient. If you have negative feelings about the situation (for example if it is an injury because of neglect or abuse), try not to let them show. This will only increase hostility between yourself and the family.
- Honestly inform them of what you are doing and what you think is wrong with the patient.
- Reassurance is important for the family as well. Involve them in the care (for example, holding the oxygen or talking to the patient to calm them). This will help develop some trust between you and the family.
INDICATIONS

- Any MEDICAL patient less than 18 years old, or any TRAUMA patient less than 16 years old

PROCEDURE

1. Scene size-up, including universal precautions, scene safety, environmental hazards assessment, need for additional resources, by-stander safety, and patient / caregiver interaction.
2. Assess patient using the pediatric triangle of ABCs:
   - Airway and appearance: speech / cry, muscle tone, inter-activeness, look / gaze, movement of extremities
   - Work of breathing: absent or abnormal airway sounds, use of accessory muscles, nasal flaring, body positioning
   - Circulation to skin: pallor, mottling, cyanosis
3. Establish spinal immobilization if suspicion of spinal injury.
4. Establish responsiveness appropriate for age. (AVPU, GCS, etc.)
5. Color code using weight-based tape / treatment chart.
6. Assess disability. (pulse, motor function, sensory function, papillary reaction)
7. Perform a focused history and physical exam. Recall that pediatric patients easily experience hypothermia and thus should not be left uncovered any longer than necessary to perform an exam.
8. Record vital signs (BP > 3 years of age, cap refill < 3 years of age)
9. Include immunizations, allergies, medications, past medical history, last meal, and events leading up to injury or illness where appropriate.
10. Treat chief complaint as per protocol.

KEY POINTS

- Illness and injuries in children can cause significant anxiety for prehospital personnel as well as panic in the patient, family, and bystanders. It is important for the EMT to remain calm and take control of the patient and situation.

Dealing with the child:

- Tell them what is happening. It is important to remember to communicate with the child.
- Relate and speak on their developmental level.
- Be honest with them. Do not say, “This won’t hurt”, if it will. Explain actions.
- Try to enlist their cooperation, if possible.
- Do not separate child from the parent unless they are ill enough to require significant interventions like airway positioning and ventilation.
- Reassure the child frequently.

Dealing with the family:

- REMAIN CALM. Show efficiency and competence, even if you do not really feel it.
- Show a caring a concerned manner for both the family and the patient. If you have negative feelings about the situation (for example if it is an injury because of neglect or abuse), try not to let them show. This will only increase hostility between yourself and the family.
- Honestly inform them of what you are doing and what you think is wrong with the patient.
- Reassurance is important for the family as well. Involve them in the care (for example, holding the oxygen or talking to the patient to calm them). This will help develop some trust between you and the family.
AIRWAY / BREATHING

AEROSOL / INHALER TREATMENTS

AEROSOL TREATMENT

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Patients experiencing bronchospasm</td>
<td>• Shortness of breath</td>
<td>• Allergy to medication</td>
</tr>
<tr>
<td></td>
<td>• Wheezing</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• History of COPD / asthma</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Unable to complete full sentences</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Accessory muscle use</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Nasal flaring</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fatigue</td>
<td></td>
</tr>
</tbody>
</table>

PROCEDURE – EMT MUST CONTACT MEDICAL CONTROL

1. Gather the necessary equipment.
2. Assemble the nebulizer kit.
3. Instill the premixed medication into the reservoir well of the nebulizer.
4. Connect the nebulizer device to oxygen at 6 - 8 liters per minute or adequate flow to produce a steady, visible mist.
5. Instruct the patient to inhale normally through the mouthpiece of the nebulizer. The patient needs to have a good lip seal around the mouthpiece if no mask.
6. The treatment should last until the solution is depleted. Tapping the reservoir well near the end of the treatment will assist in utilizing all the solution.
7. Monitor the patient for medication effects. This should include the patient’s assessment of his / her response to the treatment and reassessment of vital signs, ECG, and breath sounds.

KEY POINTS

• Use mouthpiece if patient can hold nebulizer effectively.
• Use nebulizer mask if patient is unable to hold nebulizer effectively.

PERSONAL INHALER TREATMENT – EMT DOES NOT NEED MEDICAL CONTROL

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Patients experiencing bronchospasm</td>
<td>• Shortness of breath</td>
<td>• Medication is not prescribed to patient</td>
</tr>
<tr>
<td></td>
<td>• Wheezing</td>
<td>• Medication has expired</td>
</tr>
<tr>
<td></td>
<td>• Patient has own prescribed inhaler</td>
<td>• Patient has received maximum dose</td>
</tr>
</tbody>
</table>

PROCEDURE

1. Make sure that personal inhaler is at room temperature or warmer.
2. Follow the instructions for either gentle or vigorous shaking.
3. Instruct patient to seal lips around opening of inhaler, using spacer if present.
4. Instruct patient to inhale deeply while depressing the inhaler.
5. Instruct patient to hold breathe if possible.
6. Follow the Respiratory Distress protocol.
CONTINUOUS POSITIVE AIRWAY PRESSURE (CPAP) DEVICE

INDICATIONS
- Breathing patient whose condition is not improving with oxygen therapy
- Respiratory distress or failure, due to pulmonary edema, CHF, or COPD
- Patients 16 years of age or older
- Carbon Monoxide poisoning >10%
- Flail segment without hypotension / shock

SIGNS AND SYMPTOMS
- Dyspnea and tachypnea > 25
- Chest pain
- Hypertension
- Tachycardia
- Anxiety
- Altered LOC
- Rales and wheezes
- Frothy sputum (severe cases)
- Accessory muscle use
- Retractions
- SPO2 < 94%

CONTRAINDICATIONS
- Respiratory arrest / compromise
- Agonal respirations
- Unconscious
- Shock (cardiac insufficiency)
- Pneumothorax - (with no chest tube)
- Penetrating chest trauma
- Persistent nausea and vomiting
- Facial anomalies, facial trauma
- Known blebs
- Unable to follow commands
- B/P < 90 systolic

PROCEDURE
1. Assure there is a patent airway and patient breathing are life sustaining.
2. Administer 100% oxygen via appropriate delivery system.
3. Perform appropriate patient assessment, including obtaining vital signs, SPO2 reading and cardiac rhythm.
4. Verbally instruct the CPAP procedure to the patient.
5. Apply CPAP device, starting at 5 cm H2O.
6. Slowly titrate the pressure up to patient response. 10 cm H2O maximum.
7. Continuously reassess the patient, obtaining vital signs every 5 minutes.
1. Follow the appropriate set of standing orders for your specific device for continued treatment.
2. Contact medical control as soon as possible to allow for prompt availability of hospital CPAP equipment and respiratory personnel.

KEY POINTS
- The use of CPAP has long been recognized as an effective treatment for patients suffering from exacerbation of congestive heart failure.
- Utilize aerosol treatments in-line as defined in protocol.
- The use of CPAP for the treatment of patients who might otherwise receive endotracheal intubation holds several benefits:
  1. CPAP is a less invasive procedure with lesser risk of infection. This eliminates the possibility for adverse reactions following the administration of any antibiotics given for infection.
  2. CPAP eliminates the necessity of weaning the patient off an ET tube and ventilator.
  3. CPAP used prehospitaly reduces the need to intubate patients in the hospital.
  4. CPAP allows the alert patient to have a continued dialogue with his / her caregivers. This allows for the exchange of additional medical history. It also allows for the patient to be involved in the decision-making process for his / her care.
  5. CPAP should be used as a last resort only in asthmatic patents. Prepare to intubate and ventilate.
- Certain types of CPAP devices may only produce lower <50% Fio2, consider augmentation with nasal oxygen.

For circumstances in which the patient does not improve or continues to deteriorate despite CPAP and / or medication therapy, terminate CPAP administration and perform BVM ventilation and endotracheal intubation if necessary.
**AIRWAY / BREATHING**

**CONTINUOUS POSITIVE AIRWAY PRESSURE (CPAP) DEVICE**

*Patient must have adequate respiratory effort*

- If Insufficient, go directly to BVM ventilation

**Suspected Cause?**

**Congestive Heart Failure (CHF)**
- Afebrile
- *Bilateral* rales
- JVD / HJR
- Distal edema
- Orthopnea
- CHF history
- Hypoxia

**Other respiratory etiology (such as pneumonia or COPD)**
- Fever (Pneumonia)
- Wheezing
- Hypoxia / dyspnea

**Treat per Respiratory Distress protocol first**

- If patient remains hypoxic despite traditional oxygenation therapies (nasal cannula, non-rebreather, nebulized)

**Administer CPAP**
- Start at 5 cm H2O
- May titrate up to 10 cm H2O to maintain SpO2

**Monitor SpO2, HR, LOC, and Blood Pressure. Remove or reduce CPAP if patient becomes hypotensive**

**Administer CPAP**
- Start at 5 cm H2O
- May titrate up to 10 cm H2O to maintain SpO2

**Monitor SpO2, HR, LOC, and Blood Pressure. Remove or reduce CPAP if patient becomes hypotensive**

**Patient Improving?**

- **YES**
  - Continue CPAP
  - Reassess every 5 minutes

- **NO**
  - Remove from CPAP
  - Apply BVM Ventilation

**TRANSPORT to appropriate facility**

**CONTACT** receiving facility

**CONSULT** Medical Direction where indicated

---

**KEY POINTS**

- **CPAP Indications:** Hypoxemia and SOB secondary to CHF or other causes not responding to O2 therapy
- **CPAP Contraindications:** BP <90 systolic, respiratory arrest, agonal respirations, unconscious, shock, pneumothorax, penetrating chest trauma, persistent nausea and vomiting, facial anomalies, facial trauma, known blebs, unable to follow commands, apnea, hypercarbia, and airway compromise.
- **Patient must be adequately and spontaneous breathing**

---

**ASTHMA CAUTION**

- Use extreme caution when using CPAP on ASTHMA patients.
- Use only if patient is hypoxic and not responding to any other treatment including aerosols and IM EPINEPHrine (ADRENALINE).
- Be prepared to intubate and ventilate these patients.
## END TIDAL CO2 / CAPOGRAPHY PROCEDURE

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| • The End-Tidal CO₂ shall be measured on all intubated patients, or with placements of King Airway / LMA | • Cardiac Arrest / Shock  
• Intubated Patients  
• Respiratory Failure  
• COPD  
• Hyper / Hypoventilation / Seizures  
• Sedated Patients | This device is not to be used for:  
• Detection of mainstem bronchial intubation |

### Capnography vs. Capnometry

Capnography comprises the continuous analysis and recording of carbon dioxide concentrations (CO₂) in respiratory gases. Although the terms capnography and capnometry are sometimes considered synonymous, capnometry suggests measurement (i.e., analysis alone) without a continuous waveform.

### PROCEDURE – Capnography (Intubated Patient)

Capnography is required for all patients requiring ventilation through an ET tube, King Airway / LMA.

1. Turn on recording instrumentation (usually part of a cardiac monitor in the pre-hospital setting)
2. Place CO₂ Sampling device in between ventilation device (BVM / Ventilator) and the ET / BIAD
3. Attach sampling device to recording instrumentation and ventilate to a CO₂ of 35 – 45
4. If ResQPOD is used, place ResQPOD directly on tube, followed by intubated CO₂ sampling device, then BVM.

### PROCEDURE – Capnography (Non-Intubated, spontaneously breathing patient)

1. Turn on recording instrumentation (usually part of a cardiac monitor in the pre-hospital setting)
2. Place the sampling cannula on the patient
3. Attach sampling device to recording instrumentation record results and treat per results

---

**Diagram of a normal waveform**

A-B: Dead space ventilation, beginning of exhalation  
B-C: Rapid rise in CO₂  
C-D: Alveolar plateau  
D-E: End of expiration, end tidal CO₂ (eCO₂)  
D-E: Inhalation

**RESPIRATORY CYCLE**

The primary components of the respiratory cycle are oxygenation and ventilation.

- **Oxygenation**
  - Oxygen is inhaled into the lungs and carried into the blood

- **Ventilation**
  - CO₂ is exhaled from the lungs

**Relationship between CO₂ and respiration rate**

- ↑ (↑) CO₂: Hyperventilation  
- ↓ (↓) CO₂: Hypoventilation
## KEY POINTS

### COLORIMETRIC END TIDAL CO₂ PROCEDURE

<table>
<thead>
<tr>
<th>INDICATIONS</th>

<td></td>
<td></td>
<td>• Detect mainstem bronchial intubation</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Not for continuous monitoring, use capnography</td>
</tr>
</tbody>
</table>

**PROCEDURE – Colorimetric Co2 monitoring**

1. Remove the CO₂ detector from package or activate detector.
2. Attach the CO₂ detector to a King or endotracheal tube.
3. Ventilate patient and note color change on the CO₂ detector.
4. Compare color of indicator on full end-expiration to color chart on product dome. SEE ALGORITHM BELOW.
5. The CO₂ detector shall remain in place with the airway and monitored throughout the prehospital care and transport. Any loss of CO₂ detection or color change is to be documented and monitored as procedures are done to verify or correct the airway problem.
6. Tube placement should be verified frequently and with each patient move or change in the CO₂ detector.
7. If initial intubation attempts fail, the CO₂ detector can be used for re-intubation on the same patient provided the indicator color still matches the "CHECK" color standard on product dome.

### Indicated Color

**INDICATED COLOR**

- ET tube in esophagus / BIAD not ventilating lungs - and / or – no pulmonary perfusion

**Determine if evidence of no pulmonary perfusion**
- Cardiac Arrest
- Hypoxia / Cyanosis despite oxygenation

**Re-visualize ET tube placement**
- Only leave in place if placement can be visualized and confirmed by at least one other method

**Verify placement of extraglottic airway (BIAD) is creating bilateral chest rise**
- Assure extraglottic airway (BIAD) seal
- Remove only if no chest rise

**INDICATED COLOR**

- Questionable device placement or inadequate pulmonary perfusion

**Deliver 6 additional breaths**
- If color unchanged treat as purple

**INDICATED COLOR**

- ET tube in trachea or BIAD successfully ventilating lungs

---

Northeast Ohio Regional EMS Protocol 10 | 14
INDICATIONS

- Emergent airway management of pulseless and apneic patients (EMT Provider)
- Emergent salvage airway management of apneic patients (AEMT and PARAMEDIC Provider)

CONTRAINDICATIONS

- Responsive patients with an intact gag reflex.
- Patients who have ingested caustic substances.

PROCEDURE

Lubricate device prior to insertion

LMA – Along back of airway head, not on the cuff
iGel – On both the back of the airway head and the cuff

1. Grasp the lubricated device firmly along the tube. Position the device so that the cuff outlet is facing towards the chin of the patient.
2. The patient should be in the sniffing position with head extended and neck flexed.
3. Introduce the leading soft tip into the mouth of the patient in a direction towards the hard palate.
4. Glide the device downwards and backwards along the hard palate with a continuous but gentle push until a definitive resistance is felt.

Do not apply excessive force on the device during insertion. It is not necessary to insert fingers or thumbs into the patient’s mouth during the process of inserting the device. If there is early resistance during insertion a ‘jaw thrust’ ‘Insertion with deep rotation’ or triple maneuver is recommended.

5. At this point the tip of the airway should be located into the upper esophageal opening and the cuff should be located against the laryngeal framework. Inflate LMA with indicated amount of air volume. iGel requires no inflation.
6. Secure the device - iGel - The incisors should be resting on the integral bite-block. Secure in place with tape or commercial tube securement device. LMA – Secure in place with commercial tube securement device.

To avoid the possibility of the device moving up out of position prior to being secured in place, it is essential that as soon as insertion has been successfully completed, the device is held in the correct position until and whilst the device is secured in place.
**AIRWAY / BREATHING**

**INTUBATION - ENDOTRACHEAL**

</tbody>
</table>

**PROCEDURE**

1. Cervical immobilization should be applied to the patient when indicated by mechanism of injury or when it is deemed necessary.
2. Prepare all equipment and have suction ready.
3. Hyperoxygenate the patient (one breath every three seconds) for at least one minute before attempting endotracheal intubation, if possible.
4. Suction the pharynx as needed.
5. Open the patient’s airway and holding the laryngoscope in the left hand, insert the blade into the right side of the mouth and sweep the tongue to the left.
6. Use the blade to lift the tongue and epiglottis (either directly with the straight blade or indirectly with the curved blade).
7. Once the glottic opening is visualized, slip the tube through the cords, and continue to visualize until the cuff is past the cords.
8. No more than 30 seconds may be used per attempt.
   a. Re-ventilation for at least 30 seconds after each attempt.
   b. Some situations such as copious vomiting or bleeding may require suction attempts longer than 30 seconds. These are the exception, not the norm.
9. Remove the stylet.
10. Inflate the cuff of the endotracheal tube with 10 ml of air.
11. Attach the bag-valve device to the ET tube and ventilate the patient.
12. Assess for tube placement:
   a. Watched tube pass through cords.
   b. Waveform Capnography
   c. Confirmation of lung sounds in the apices and bases bilaterally.
   d. Absence of epigastric sounds.
   e. Chest rises with ventilation.
   f. Good compliance with bag-valve ventilation
   g. Patent color improves.
   h. SpO₂ improves. (If distal perfusion is present to create a reading)

If at any time placement cannot be confirmed or obtained, the ETT shall be removed, an alternate airway shall be ventilated. **If there is any doubt about proper placement, the tube shall be removed.**

13. If proper placement is confirmed, the cm markings on the tube at the level of the teeth shall be noted and secure the tube with a commercial tube holder.
14. Document ETT size, time, result, and placement location by the centimeter marks either at the patient’s teeth or lips on the patient care report (PCR). Document all devices used to confirm initial tube placement. Also, document breath sounds before and after each movement of the patient.
15. Routinely reassess for proper tube placement. The initial tube placement and all reassessments must be documented.

**KEY POINTS**

- It is essential to have complete and detailed documentation concerning the placement of the endotracheal tube. The documentation MUST include: Methods used, success / failure, pre-oxygenation, suction, SpO₂, CO₂, medications used, visualization, tube size, lip line, all confirmation techniques, securement of tube, and repeat assessments of placement.
- Placement - direct visualization of the tube passing through the vocal cords.
- Applying c-collar may assist in minimizing ETT movement after placement.
- It is the responsibility of the practitioner to be familiar with the proper technique of using the different laryngoscope blades.
- Tube placement must be confirmed; after it was initially placed, after every movement, any significant change in patient status, and prior to entering the emergency department.
- Continually monitor the patient’s SpO₂, EtCO₂, ease of ventilation, heart rate, and presence of JVD.
- A complication of endotracheal intubation and / or manual ventilation is a pneumothorax and tension pneumothorax. Refer to the chest decompression procedure if this occurs.
- Only functioning paramedics and AEMT may intubate. AEMT’S may only intubate patients who are apneic.
- Intubation does NOT have to be attempted if their airway can be effectively managed with BVM ventilations.
- Have tube placement confirmed immediately upon entering the ER by a Physician prior to moving patient to ER bed.
BOUGIE ASSISTED INTUBATION

1. Prepare patient as described above for standard orotracheal intubation.
2. Use laryngoscope to lift mandible and displace tongue as normal.
3. Use the gum rubber bougie with the bent end up in place of an ETT.
4. Pass the bougie through the cords, this works as a place keeper to an ETT can be slide over the Bougie and into the trachea.
5. Pass a generously lubricated tube over the Bougie and into the trachea. Do not use force to advance the tube past the vocal cords.
6. Pull the Bougie out once the tube has been passed to the desired depth, inflate the ETT cuff, and verify tube placement using all standard methods.

VIDEO LARYNGOSCOPY - OTHER DEVICES

Video laryngoscopes are permitted to be substituted for standard laryngoscopes during intubation procedures. The user must have previous training specific to the make and model of laryngoscope being used and have and must have a standard laryngoscope set available in the event of device failure. Manufacturer’s recommendations must be followed on use, sizing, disposal or cleaning, indications, and contraindications for the device. A BIAD device must still be available if unable to pass an endotracheal tube with either video or standard laryngoscopy.

PEDIATRIC TUBE SIZING

For children, the proper tube is usually equal to the size of the child’s little finger. The following guide will also help in determining the proper size tube:

<table>
<thead>
<tr>
<th>Age</th>
<th>Tube Size (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Premature</td>
<td>3 mm (id)</td>
</tr>
<tr>
<td>14-24 weeks</td>
<td>4 mm (id)</td>
</tr>
<tr>
<td>6-12 months</td>
<td>4-5 mm (id)</td>
</tr>
<tr>
<td>12-18 months</td>
<td>5 mm (id)</td>
</tr>
<tr>
<td>18-24 months</td>
<td>5-6 mm (id)</td>
</tr>
<tr>
<td>2-4 years</td>
<td>6 mm (id)</td>
</tr>
<tr>
<td>4-7 years</td>
<td>6-7 mm (id)</td>
</tr>
<tr>
<td>7-10 years</td>
<td>7-8 mm (id)</td>
</tr>
</tbody>
</table>

**KEY POINTS**

- All the above tube sizes are still dependent on the child’s size rather than consideration of age.

TUBE REMOVAL

If the patient begins to breathe spontaneously and effectively and is resisting the presence of the tube, removal of the tube may be necessary. The following procedures will be followed:

1. Explain procedure to victim.
2. Prepare suction equipment with large-bore catheter and suction secretions from endotracheal tube, mouth, and pharynx.
3. The lungs should be completely inflated so that the patient will initially cough or exhale as the tube is taken from the larynx. This is accomplished in 2 ways:
   a. The patient is asked to take the deepest breath they possibly can, and, at the very peak of the inspiratory effort, the cuff is deflated, and the tube removed rapidly; or
   b. Positive pressure is administered with a hand-held ventilator and, at the end of deep inspiration, the cuff is deflated, and the tube rapidly removed.
4. Prepare to suction secretions and gastric content if vomiting occurs.
5. Appropriate oxygen is then administered.
6. The patient’s airway is immediately evaluated for signs of obstruction, stridor or difficulty breathing. The patient should be encouraged to take deep breaths and to cough.
INDICATIONS

- Emergent airway management of pulseless and apneic patients (EMT Provider)
- Emergent salvage airway management of apneic patients (AEMT and PARAMEDIC Provider)

CONTRAINDICATIONS

- Responsive patients with an intact gag reflex.
- Patients with known esophageal disease. (varices)
- Patients who have ingested caustic substances.

PROCEDURE

1. Hold the King Airway at the connector, using the dominant hand.
2. With non-dominant hand, hold mouth open and apply chin lift.
3. Using a lateral approach, introduce device into corner of mouth.
4. Advance tip behind the base of the tongue, while rotating tube back to midline so that the blue orientation line faces the chin of the patient.
5. Without exerting excessive force, advance tube until base of connector is aligned with teeth or gums.
6. Attach the syringe and inflate the cuffs to the appropriate volume:
   - SIZE 2 = 25-35 ml (LT or LTS-D)
   - SIZE 2.5 = 30-40 ml (LT or LTS-D)
   - SIZE 3 = 40-55 ml (LT or LTS-D)
   - SIZE 4 = 50-70 ml (LT or LTS-D)
   - SIZE 5 = 60-80 ml (LT or LTS-D)
7. Attach a bag-valve device to the connector. While gently bagging the patient to assess ventilation, gently withdraw the tube until ventilation is easy and free flowing (large tidal volume with minimal airway pressure).
8. Adjust cuff inflation, if necessary, to obtain a seal of the airway.
9. After placement, perform standard checks for breath sounds and utilize an appropriate carbon dioxide detection device, as required by protocol.

REMOVAL OF DEVICE (if indicated):

1. Confirm need for removal of the device.
2. Suction above cuffs in the oral cavity.
3. FULLY deflate both cuffs before removal of the device. (may require multiple attempts of air removal with syringe to fully evacuate air)
4. Remove the device when protective reflexes have returned.
KEY POINTS

1. The key to insertion is to get the distal tip of KING around the corner in the posterior pharynx, under the base of the tongue. Experience has indicated that a lateral approach, in conjunction with a chin lift, facilitates placement of the KING. Alternatively, a laryngoscope or tongue depressor can be used to lift the tongue anteriorly to allow easy advancement of the KING into position.

2. Insertion can also be accomplished via a midline approach by applying a chin lift and sliding the distal tip along the palate and into position in the hypopharynx. In this instance, head extension may also be helpful.

3. As the KING is advanced around the corner in the posterior pharynx, it is important that the tip of the device is maintained at the midline. If the tip is placed or deflected laterally, it may enter the piriform fossa and the tube will appear to bounce back upon full insertion and release. Keeping the tip at the midline assures that the distal tip is placed properly in the hypopharynx / upper esophagus.

4. Depth of insertion is key to providing a patent airway. Ventilatory openings of the KING must align with the laryngeal inlet for adequate oxygenation / ventilation to occur. Accordingly, the insertion depth should be adjusted to maximize ventilation. Experience has indicated that initially placing the KING deeper (proximal opening of gastric access lumen aligned with teeth or gums), inflating the cuffs, and withdrawing until ventilation is optimized results in the best depth of insertion for the following reasons:
   - It ensures that the distal tip has not been placed laterally in the piriform fossa (see item #3 above).
   - With a deeper initial insertion, only withdrawal of the tube is required to realize a patent airway. A shallow insertion will require deflation of the cuffs to advance the tube deeper.
   - As the KING is withdrawn, the initial ventilation opening exposed to or aligned with the laryngeal inlet is the proximal opening. Since the proximal opening is closest to and is partially surrounded by the proximal cuff, airway obstruction is less likely, especially when spontaneous ventilation is employed.
   - Withdrawal of the KING with the balloons inflated results in a retraction of tissue away from the laryngeal inlet, thereby encouraging a patent airway.

5. Ensure that the cuffs are not over-inflated. If a cuff pressure gauge is not available, inflate cuffs with the minimum volume necessary to seal the airway at the peak ventilatory pressure employed. (just seal volume)

6. Removal of the KING is well tolerated until the return of protective reflexes. For later removal, it may be helpful to remove some air from the cuffs to reduce the stimulus during wake-up.

7. King Airway Kit Includes:
   - King Airway
   - 60-80 cc Syringe
   - Lubricant
   - Instructions for use

---

DO NOT GIVE MEDICATIONS DOWN THE KING AIRWAY

KING VISION

**AIRWAY / BREATHING**

**STEP 1 – Preparing the King Vision Video Laryngoscope (the Display and Blade combination) for use**

Choose the style of Blade (Standard or Channeled) to be used.

Install the Display into the Blade (only goes together one way). Listen for a “click” to signify that the Display is fully engaged with the Blade. Note that the front and back of the parts are color-coded to facilitate proper orientation.

<table>
<thead>
<tr>
<th>Using The King Vision Channeled Blade</th>
<th>Using The King Vision Standard Blade</th>
</tr>
</thead>
<tbody>
<tr>
<td>The size #3 Channeled blade is designed to be used with standard ETT sizes 6.0 to 8.0. No stylet is needed.</td>
<td>The size #3 Standard blade is used when integral guidance of the ETT is not indicated. In this case, a stylet will-likely be necessary.</td>
</tr>
<tr>
<td>Lubricate the ETT, the guiding channel of the Channeled Blade and the distal tip of the Blade using a water soluble lubricant. Take care to avoid covering the imaging element of the blade with lubricant. The ETT may be preloaded into the guiding channel with its distal tip aligned with the end of the channel. Note that the ETT tip should not be evident on the screen when loaded properly. Alternatively, the ETT can be inserted into the channel after the blade has been inserted into the mouth and the vocal cords have been visualized.</td>
<td>Lubricate the distal tip of the Standard Blade using a water soluble lubricant. Take care to avoid covering the imaging element of the blade with lubricant. The ETT and stylet should be lubricated and the stylet pre-loaded into the ETT in the same manner as with other intubations where a stylet is used. User tip: Shaping the ETT with a pre-loaded stylet to match the blade curvature may be helpful.</td>
</tr>
</tbody>
</table>

**Step 2 – Powering On**

Press the POWER button (Fig. 1, #4) on the back of the King Vision Display. The King Vision Display should turn “ON” immediately AND Display shows a moving image. Confirm the imaging of the King Vision is working properly. If not, stop and refer to the “Acquiring an Image” section. IMPORTANT: If the LED Battery indicator light (Fig. 1, #5) in the upper left hand corner of the King Vision Display is FLASHING RED, the battery life remaining is limited and the batteries should be replaced as soon as possible.

**Step 3 – Insertion of King Vision Blade into the Mouth**

Open the patient’s mouth using standard technique.

In the presence of excessive secretions/blood, suction the patient’s airway prior to introducing the Blade into the mouth. Insert the Blade into the mouth following the midline. Take care to avoid pushing the tongue towards the larynx. As the Blade is advanced into the oropharynx, use an anterior approach toward the base of the tongue. Watch for the epiglottis and direct the Blade tip towards the vallecula to facilitate visualization of the glottis on the Display’s video screen. The King Vision Blade tip can be placed in the vallecula like a Macintosh blade or can be used to lift the epiglottis like a Miller blade. For best results, center the vocal cords in the middle of the Display’s video screen. If the lens becomes obstructed (e.g., blood/secretions), remove the Blade from the patient’s mouth and clear the lens. Avoid putting pressure on the teeth with the King Vision Video Laryngoscope.

**Step 4 – ETT Insertion**

<table>
<thead>
<tr>
<th>Advance the ETT (Channeled Blade)</th>
<th>Insert the ETT/Stylet (Standard Blade)</th>
</tr>
</thead>
<tbody>
<tr>
<td>After you can see the vocal cords in the center of the King Vision Display, advance the ETT slowly and watch for the cuff to pass through the vocal cords. Note that minor manipulation of the blade may be needed to align the ETT tip with the vocal cords.</td>
<td>After you can see the vocal cords on the King Vision Display, insert the ETT with pre-loaded stylet into the mouth using a lateral approach. Once the ETT tip has reached the posterior pharynx, manipulate the ETT to direct its tip toward the vocal cords. Advance ETT tip just through the cords then retract the stylet prior to advancing the ETT into position in the trachea with the cuff below the cords. Fully remove the stylet.</td>
</tr>
</tbody>
</table>
NEEDLE CRICOTHYROTOMY (Only if Trained)

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>COMPLICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Management of an obstructed airway when standard airway procedures cannot be accomplished or have failed. • Unable to intubate by another route. • Cervical spine injuries • Maxillo facial trauma • Laryngeal trauma / edema</td>
<td>Airway obstruction from: • Edema from infection, caustic ingestion, allergic reaction, and / or inhalation injuries • Foreign body • Mass lesion</td>
<td>• Post procedure bleeding • Cellulitis of neck • Subcutaneous emphysema • Voice change • Feeling of lump in throat • Persistent stoma • Obstructive problems • Misplacement</td>
</tr>
</tbody>
</table>

This procedure buys TIME only. It is not a definitive airway. It will provide OXYGENATION only, not appropriate VENTILATION.

PROCEDURE
1. If time permits, prep with appropriate antiseptic solution.
2. Have suction supplies available and ready.
3. Locate the cricothyroid membrane utilizing anatomical landmarks (in the midline between thyroid cartilage and cricoid cartilage).
4. Secure larynx laterally between thumb and forefinger.
5. Relocates the cricothyroid membrane.
6. Using a syringe attached to a short 10 to 14-gauge catheter-over-needle device if needed, insert the needle through the cricothyroid membrane at a 45 to 60-degree angle caudally (towards feet).
7. Confirm entry of needle in trachea by aspirating air through the syringe.
8. If air is present, change the angle of insertion to 60 degrees.
9. Advance the catheter to the level of the hub.
10. Carefully remove the needle and syringe.
11. Secure the cannula to patient.
12. Attach the cannula to a 15 mm adapter. (3.0 – 3.5 pediatric ET tube adapter)
13. Attach a BVM to the airway adapter and begin oxygenation.
14. Make certain ample time is used not only for inspiration but expiration as well.
15. If unable to obtain an adequate airway, resume basic airway management and transport the patient as soon as possible.
16. Regardless of success or failure of needle cricothyrotomy, notify the receiving hospital at the earliest possible time of a surgical airway emergency.

KEY POINTS
• Use needle cricothyrotomy as a bridge to more invasive surgical airways. (Tracheotomy, surgical cricothyrotomy)
• If placement is required due to foreign body obstruction, removal attempts should continue after performing needle cricothyrotomy procedure.
• Use procedure early to prevent ongoing hypoxia if foreign body is not easily removed.
• QuickTrach device provides a better airway and ventilation if device is available and provider has undergone specific training for that device. See Cricothyotomy / QuickTrach Procedure.
CRICOTHYROTOMY – KIT (Only if trained)

</tr>
</tbody>
</table>

This procedure will provide OXYGENATION and life sustaining VENTILATION in an emergency.

PROCEDURE
1. If time permits, prep with appropriate antiseptic solution.
2. Have suction supplies available and ready.
3. Locate the cricothyroid membrane utilizing anatomical landmarks.
4. Secure larynx laterally between thumb and forefinger.
5. Relocate the cricothyroid membrane (in the midline between thyroid cartilage and cricoid cartilage).
6. Using the syringe and the finder needle supplied in the QuickTrach kit, insert the needle through the cricothyroid membrane at a 45 to 60-degree angle caudally (toward the feet).
7. Confirm entry of needle in trachea by aspirating air through the syringe.
8. If air is present, change the angle of insertion to 60 degrees.
9. Advance the device to the level of the stop guide.
10. Remove the stop guide and slide the plastic cannula along the needle into the trachea until the flange rests against the neck.
11. Carefully remove the needle and syringe.
12. Secure the cannula with the provided anchoring device.
13. Attach the connecting tube to the 15mm connection.
14. Attach a BVM to the connecting tube.
15. Confirm placement by auscultation and observing patient for adequate chest rise. Make certain ample time is used not only for inspiration but expiration as well.
16. If unable to obtain an adequate airway, resume basic airway management and transport the patient as soon as possible.
17. Regardless of success or failure of the placement of QuickTrach, notify the receiving hospital at the earliest possible time of a surgical airway emergency.

KEY POINTS

Guidelines for Sizing
• Adult (4.0 mm) QuickTrach: Any patient greater than 100 pounds (45kg) and greater than 8 years in age.
• Use a scalpel to make a VERTICAL MIDLINE incision over the cricothyroid membrane if the landmarks are difficult to identify. Once identified, use the QuickTrach as noted above.
MEDICAL PROCEDURES

SURGICAL CRICOTHYROTOMY (Only if trained)

CONTRAINDICATIONS:
• Ability to oxygenate and ventilate using less invasive measures
• Age less than 12 years old

PROCEDURE:

Position the patient supine and extend the neck as needed to improve anatomic view.

1. Prep neck with antiseptic
2. Using your non-dominant hand, stabilize the larynx and locate the following landmarks: thyroid cartilage (Adam’s apple) and cricoid cartilage. The cricothyroid membrane lies between these cartilages.
3. Make an approximately a 3cm vertical incision 0.5cm deep through the skin and fascia, over the cricothyroid membrane. With finger, dissect the tissue and locate the cricothyroid membrane.
4. Make approximately a 1.5cm horizontal incision through the cricothyroid membrane.
5. With your finger, bluntly dilate the opening through the cricothyroid membrane.
6. Insert the bougie curved tip first through the incision and angled towards the patient’s feet.
7. Advance the bougie into the trachea feeling for “clicks” of tracheal rings and until “hangup” when it cannot be advanced any further. This confirms tracheal position.
8. Advance a 6.0 mm endotracheal tube (ensure all air aspirated out of cuff) over the bougie and into the trachea.
9. Remove bougie while stabilizing ETT ensuring it does not become dislodged
10. Inflate the cuff with 5 – 10ml of air.
11. Confirm appropriate proper placement by symmetrical chest-wall rise, auscultation of equal breath sounds over the chest and a lack of epigastric sounds with ventilations using bag-valve-mask, condensation in the ETT, and quantitative waveform capnography.
12. Reassess tube placement frequently, especially after movement of the patient.
13. Ongoing monitoring of ETT placement and ventilation status using waveform capnography is required for all patients.
14. Regardless of success or failure of needle cricothyrotomy, notify the receiving hospital at the earliest possible time of a surgical airway emergency.

KEY POINTS
• Be prepared for a spray of blood while cutting through the cricothyroid membrane. Eye and face protection required.
• More definitive airway than percutaneous catheter airways
• May begin with needle cricothyrotomy and transition to surgical cricothyrotomy
• Traditional commercial tube securing devices unlikely to work to secure ET tube. Do not let go of tube until secured with best option available.
# Needle Chest Decompression

## Indications

- Tension pneumothorax with significant dyspnea

## Signs and Symptoms

- Tachypnea / tachycardia
- Hyperresonance
- Absent breath sounds on the affected side
- Possibly diminished breath sounds on the unaffected side.
- Cyanosis
- Hypotension
- Distended neck veins
- Chest pain
- Extreme anxiety
- Altered LOC/coma

## Precautions

- Insufficient training

## Procedure

1. Confirm presence of a tension pneumothorax or identify strong clinical evidence in a rapid deteriorating patient in the setting of major trauma. Consider in the setting of refractory PEA / traumatic arrest.
2. Locate the insertion site at the second intercostal space at the midclavicular line on the affected side of the chest.
3. Prep the insertion site. Use sterile gloves and fully utilize aseptic procedure possible under the circumstances.
4. Remove rear cap of IV catheter.
5. Insert the 3 – 3.25 inch, 12 - 14-gauge IV catheter (1 inch, 18-gauge IV catheter in patients less than 8 years) by directing the needle just over the top of the third rib (2nd intercostal space) to avoid intercostal nerves and vessels which are located on the inferior rib borders. Alternate site, 5th intercostal space mid axillary or anterior axillary line.
6. Advance the catheter 1 - 2 inches (3/4 - 1 inch in patients less than 8 years) through the chest wall. Tension should be felt until the needle enters the pleural space. A pop or give may also be felt. Do not advance the needle any further.

   In a tension pneumothorax, air under pressure should be released when the needle enters the pleural cavity. This will be heard as a rush of air through an open catheter-over-the-needle. If you are using a syringe attached to the catheter-over-the-needle you should be able to withdraw air by pulling out on the barrel of the syringe.

7. Withdraw the needle and advance the catheter until flush with the skin. Listen for a gush or hiss of air which confirms placement and diagnosis. This is frequently missed due to ambient noise.
8. Dispose of the needle properly and **never reinsert into the catheter**.
9. Once the presence of a tension pneumothorax has been confirmed:
   - Remove the needle, leaving the catheter in place.
   - Tape the catheter in place.
10. Secure the catheter and rapidly transport the patient providing appropriate airway assistance.
11. Be prepared to re-needle the chest next to original site if catheter kinks or becomes occluded.

## Key Points

- A tension pneumothorax can occur in any situation in which a simple pneumothorax occurs.
- Some patients who are at risk of developing a tension pneumothorax; include those receiving positive pressure ventilation, or any patient with blunt or penetrating trauma, and those with pre-existing lung diseases such as COPD.
- Cover all penetrating chest trauma with an occlusive dressing taped on three sides.
- In some cases of penetrating chest trauma, placing an occlusive dressing on the wound will convert an open pneumothorax to a closed tension pneumothorax. In these cases, treatment consists of removing the dressing and converting the wound back to an open pneumothorax. This may be the only treatment needed.
- **DO NOT** perform a chest decompression, if the patient is not in significant respiratory distress and is otherwise stable.
- **Major trauma victims should have catheter-over-the-needles placed on both sides of the chest, if all the following are present:**
  1. Obvious chest trauma
  2. Difficulty bagging, and absent breath sounds on one / both sides
  3. Hypotensive or pulseless
- Needle decompression is a temporary lifesaving procedure only. Patients requiring decompression will require chest tube placement for long term maintenance.
- Catheters may kink or become occluded, always be prepared to re-needle the chest next to the original site. **BE ALERT FOR SIGNS OF CONTINUEING OR RECURRING TENSION PNEUMOTHORAX.**
INDICATIONS

- Patients with suspected hypoxemia.
- All cases of respiratory distress
- For the treatment of primary respiratory or cardiac disease
- All cases of altered or depressed level of consciousness
- Drug overdoses
- Any patient requiring intubation or BVM support
- Major trauma
- Smoke Inhalation (may not be accurate due to CO)
- Any patient on home oxygen, home ventilator, or BiPAP

SIGNS AND SYMPTOMS

- Dyspnea
- Tachypnea
- Tachycardia
- Bradycardia (late sign in adults)
- Altered mental status
- Pallor, cyanosis
- Diaphoresis
- Prolonged capillary refill
- Accessory muscle use
- Abnormal breath sounds

PRECAUTIONS

- Poor perfusion; must be applied with good perfusion
- Patients with history of anemia
- Patients with suspected high carboxyhemoglobin / methemoglobin (CO poisoning, smoke inhalation, heavy cigarette smokers)

PROCEDURE

1. Turn the machine on and allow for self-tests.
2. Apply probe to patient’s finger or any other digit as recommended by the device manufacturer.
3. Allow machine to register saturation level.
4. Record time and initial saturation percent on room air if possible on the patient care report (PCR).
5. Verify pulse rate on machine with actual pulse of the patient.
6. Monitor critical patients continuously until arrival at the hospital. If recording a one-time reading, monitor patients for a few minutes as oxygen saturation can vary.
7. Document percent of oxygen saturation every time vital signs are recorded and in response to therapy to correct hypoxemia.
8. In general, normal saturation is 97 - 99%. Below 94%, suspect a respiratory compromise.
9. Use the pulse oximetry as an added tool for patient evaluation. Treat the patient, not the data provided by the device.
10. The pulse oximeter reading should never be used to withhold oxygen from a patient in respiratory distress or when it is the standard of care to apply oxygen despite good pulse oximetry readings, such as chest pain.
11. Factors which may reduce the reliability of the pulse oximetry reading include:
   - Poor peripheral circulation. (blood volume, hypotension, hypothermia)
   - Excessive pulse oximeter sensor motion.
   - Fingernail polish. (may be removed with acetone pad or sensor turned 90 degrees)
   - Carbon monoxide bound to hemoglobin.
   - Irregular heart rhythms. (atrial fibrillation, SVT, etc.)
   - Jaundice.
   - High ambient light. (washes out the sensors light)

All patients who require vital signs to be taken should have oxygen saturation measured and recorded as part of the vital signs.

Measure oxygen saturation before applying oxygen and repeat the measurement after oxygen has been applied. Do not delay oxygen administration in patients experiencing severe respiratory distress.
## TREATMENT GUIDELINES

<table>
<thead>
<tr>
<th>SPO2 READING</th>
<th>INTERPRETATION</th>
<th>ACTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;94%</td>
<td>Ideal Range</td>
<td>No supplemental oxygen is needed if no distress noted</td>
</tr>
<tr>
<td>93% TO 90%</td>
<td>Mild to Moderate Hypoxemia</td>
<td>Check airway start oxygen therapy via nasal cannula @ 2 - 6 lpm</td>
</tr>
<tr>
<td>90% TO 85%</td>
<td>Severe Hypoxemia</td>
<td>Check airway start aggressive oxygen therapy, high flow oxygen via nonrebreather mask @ 15 lpm. Consider bag valve mask ventilation with 100% oxygen if the patient does not have adequate ventilations. Consider CPAP if indicated.</td>
</tr>
<tr>
<td>85% OR LESS</td>
<td>Respiratory Failure</td>
<td>Prepare to intubate or assist ventilations with 100% oxygen and bag valve mask</td>
</tr>
</tbody>
</table>

## KEY POINTS

- 100% oxygen should be administered to all patients despite a good SpO2 if they are hypoxic.
- Make sure that all dirt and nail polish or any obstructive covering is removed to prevent the unit from giving a false reading.
- Attempt to obtain a room air reading and a reading with supplemental oxygen.
- DO NOT read while BP being taken. May give false readings.
- Oxygen saturation measurements must routinely be recorded as part of the run report. Include those measurements taken as part of routine vital signs and those measurements taken before and after oxygen administration.
- Although the pulse oximeter displays the heart rate, the unit should not be used in place of a physical assessment of the heart rate.
- Oxygen saturation readings may be inaccurate in any situation where the flow of blood through the finger is impaired, such as:
  - Hypotension or shock with poor peripheral perfusion
  - Peripheral vascular disease
  - Extremity injury with restriction of peripheral perfusion
  - Cold extremities
- Oxygen saturation readings may be incorrectly high in situations such as carbon monoxide poisoning.
- Many patients with COPD have chronic low oxygen readings and may lose their respiratory drive if administered prolonged high oxygen therapy. Routinely assess pulse oximetry as well as respiratory drive when administering oxygen to these patients. Do not withhold oxygen from any patient that requires it.
- The room air pulse oximetry reading is NOT required if the patient has been placed on supplemental oxygen prior to EMS arrival.
- Pulse oximetry is NOT and indicator of myocardial or cerebral perfusion.
AIRWAY / BREATHING

STOMA and TRACHEOSTOMY CARE PROCEDURE

TRACHEOSTOMY SUCTIONING

PURPOSE

Tracheostomy suctioning may be required to maintain a patent airway in patients who present with respiratory distress secondary to tracheostomy tube occlusion or obstruction.

INDICATIONS

- Increased secretions from the Tracheostomy site or a mucous plug
- Hypoxia, cyanosis, or decreased oxygen saturation levels
- Increased work of breathing
- Altered mental status secondary to hypoxia
- Dislodged/obstructed tracheostomy

ADVERSE EFFECTS/COMPLICATIONS

- Bleeding at tracheal stoma site
- Dislodgment of tracheostomy tube
- Exaggerated cough reflex with introduction of saline
- Increased hypoxia/respiratory distress
- Infection

CONTRAINDICATIONS

- NONE

PROCEDURE

1. Position patient with the head and neck hyperextended to expose the tracheostomy site.
2. Pre-oxygenate patient at the tracheostomy site:
   (a) NRB mask if patient has adequate effective spontaneous respirations
   (b) Manual resuscitator bag if ventilator-dependent or there are ineffective spontaneous respirations
3. Select appropriately sized suction catheter.
4. Insert suction catheter:
   (a) Measure from the tracheostomy site to the sternal notch OR Insert until there is a cough reflex.
5. Apply suction ONLY as the catheter is withdrawn, rotating the catheter in a twisting motion between thumb and finger.
8. Repeat suction procedure as needed (for thick secretions instill 3–5 cc sterile saline/water prior to repeat suctioning). Usually suctioning will fix the trach problem. If it does not, try suctioning again because mucous plugging is a very common cause of trach failure.
9. If there is suspicion that the trach is the cause of cardiac arrest and/or for difficult tracheostomy/laryngectomy management transport to nearest emergency department.
### AIRWAY / BREATHING

#### STOMA and TRACHEOSTOMY CARE PROCEDURE

#### TRACHEOSTOMY TUBE REPLACEMENT

**PURPOSE**
Changing a tracheostomy tube may be required to reestablish a patent airway in patients who present with respiratory distress secondary to tracheostomy tube occlusion or obstruction that has not been relieved through suctioning.

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>ADVERSE EFFECTS/COMPLICATIONS</th>
<th>CONTRAINdicATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Inability to ventilate with manual resuscitator bag</td>
<td>• Inability to reinsert a tracheostomy tube</td>
<td>• NONE</td>
</tr>
<tr>
<td>• Ineffective spontaneous ventilations (poor chest rise, decreased breath sounds bilaterally)</td>
<td>• Edema or bleeding at stoma site</td>
<td>but tracheostomy tube replacement and/or ETT should be attempted as a last resort after multiple attempts at suctioning and oxygenation have failed</td>
</tr>
<tr>
<td>• Hypoxia, cyanosis, or decreased O2 saturation levels, not relieved by suctioning</td>
<td>• Inability to maintain adequate chest rise and fall with assisted ventilations due to air leak around uncuffed tracheostomy tube</td>
<td></td>
</tr>
<tr>
<td>• Increased work of breathing</td>
<td>• False tracheostomy para-tracheal intubation (avoid forced tracheostomy tube re-placement or ETT intubation)</td>
<td></td>
</tr>
<tr>
<td>• Altered mental status secondary to hypoxia</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**PROCEDURE**

1. Position patient with the head and neck hyperextended to expose the tracheostomy site.
2. Explain procedure to patient/family.
3. To exchange the tracheostomy tube:
   a. If a double cannula tracheostomy tube is in place, attempt to change inner cannula first and reassess the patient to see if the obstruction is relieved. If the patient continues to have respiratory distress, and diligent suctioning was unsuccessful, then change the entire tracheostomy tube. If cuffed, deflate using a 10 mL syringe.
   b. Insert Bougie through existing trach tube to maintain tract.
   c. Remove the tracheostomy tube, outward and backward towards the chest.
   d. Lubricate the new tracheostomy tube with lubricating jelly or saline/water.
   e. Insert new tracheostomy tube into stoma, inward and downward towards the lungs. **STOP IF YOU MEET RESISTANCE.**
   f. If cuffed tracheostomy tube is used, once the tube has been inserted, inflate the cuff with an appropriate amount of air to avoid air leak around the tube (1–3 mL for pediatric tubes and 5–10 mL for adult tubes).
   g. Reassess the patient. Oxygenate as needed.
   h. With good chest rise and fall and improved skin color, secure the tracheostomy tube with ties or Velcro at the back of the neck, so only one fingertip fits between the neck and the ties.
4. If ALS, you may attempt to insert a same size or 1/2 smaller sized endotracheal tube into the stoma.
   a. In the event that the stoma size is unknown start with a size 6 mm ETT. If cuffed endotracheal tube is used, inflate the cuff with an appropriate amount of air to avoid air leak around the tube (1–3 mL for pediatric tubes and 5–10 mL for adult tubes). Advance cuffed ETT just until you lose sight of the cuff.
   b. If ALS and unable to insert the endotracheal tube into the stoma, AND the patient certainly has not had a laryngectomy, you may attempt to intubate orally and apply an occlusive dressing over the stoma site.
5. If you meet resistance inserting the tracheostomy tube, do NOT force the tube into the stoma. Assess the patient.

6. If you continue to have problems, STOP, consult Online Medical Control, and continue BVM ventilations orally, or manual resuscitator bag to tracheostomy site, while en-route to the nearest emergency department.
   (a) If all attempts at exchanging a tracheostomy tube have failed, you may need to ventilate through the stoma using an infant size mask with an appropriate size manual resuscitator bag.

### KEY POINTS

- Attempting to reinsert a dislodged tracheostomy tube or intubating a stoma may cause a false channel in the subcutaneous tissue anterior to the trachea. Compression of the trachea may result. **Do not use force!**

- Document ETT size, time, results (success) and placement location by the centimeter marks in the ePCR. Document all devices used to confirm initial tube placement. Also document positive or negative breath sounds before and after each movement of the patient. It is required that the airway be monitored continuously through waveform capnography (ALS providers) and pulse oximetry. A digital copy of the ETCO2 MUST be attached to the ePCR.

- Manually secure the tracheostomy tube while beginning to ventilate the patient using a manual resuscitator bag

- The tracheostomy outer cannula has a 15 mm fitting on the end that will attach to a manual resuscitator bag just like an ET tube.

- Attempt to re-place the tracheostomy tube (if possible) before attempting to secure the airways via ETT.

- Advance cuffed ETT just until you lose sight of the cuff. Secure the ETT and promptly monitor the ETCO2.

- Oral intubation may not be possible in some tracheostomy dependent patients, depending on
AIRWAY / BREATHING

STOMA and TRACHEOSTOMY CARE PROCEDURE

Tracheostomy Patient Management Protocol

Is the patient breathing?

NO

Start CPR if no pulse

YES

Apply high flow oxygen to BOTH face and stoma

ASSESS TRACHEOSTOMY PATENCY

Remove speaking valve or cap (if present)
Remove Inner cannula (if present) - clean or replace

Does the patient have a tracheostomy tube present?

YES

Can you pass a suction catheter gently through the tracheostomy tube?

NO

Attempt suctioning

Is the patient stable or improving?

YES

NO

Attempt suctioning

Is the patient stable or improving?

NO

Exchange the Tracheostomy Tube

Ensure O2 re-applied to BOTH face and stoma

NO / Stoma Only

Attempt suctioning

Is the patient stable or improving?

NO

• Standard ORAL airway maneuvers as needed
• Administer O2 via stoma
• Tracheostomy stoma ventilation
• Consider pediatric mask with adult size BVM

YES

Repeat Suctioning

• Consider partial obstruction ventilate via tracheostomy if needed
• Ventilate / oxygenate via trach tube as needed
• If not breathing Continue ABCDE assessment
• Consider transporting to nearest emergency department

• Insert new tracheostomy tube (if available)
• Attempt intubation of stoma
  5.0 / 6.0 cuffed ETT (Use Bougie)
• If not possible, consider ORAL intubation

⚠️ Prepare for difficult intubation
Oral intubation may not be possible in some trach dependent patients

EMT Intervention

AEMT Intervention

PARAMEDIC Intervention

Online Medical Control
**AIRWAY / BREATHING**

**SUCTIONING**

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>PRECAUTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Any patient who is having trouble maintaining an airway and fluid is noted in the oropharynx, endotracheal tube, or tracheotomy</td>
<td>• Obstruction of the airway (secondary to secretions, blood, or any other substance) in a patient currently being assisted by an airway adjunct such as a nasotracheal tube, endotracheal tube, tracheostomy tube, or a cricothyrotomy tube</td>
<td>• The patient must be well oxygenated before attempting this procedure</td>
</tr>
<tr>
<td>• Tracheal suctioning should also be performed when rhonchi is heard in the intubated patient or tracheotomy patients</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**PROCEDURES**

**ORAL SUCTIONING**
1. Body substance isolation procedures must be used.
2. Assess the need for suctioning.
3. Oxygenate the patient for 30 seconds prior to suctioning.
4. Select an appropriate size suction catheter.
   a. A soft flexible suction catheter or a “whistle tip” can be used if only fluids need to be removed.
   b. A yankauer or “tonsil tip” should be used for thick fluids, small particles, or large volumes.
5. Prepare a cup of sterile water or saline to flush the catheter after suctioning and in between attempts.
6. Quickly insert the catheter into the patient’s mouth until it is at the desired depth.
7. Apply suction and withdraw the catheter. Suction no more than 15 seconds per attempt.
8. Immediately after each suction attempt, oxygenate the patient for thirty seconds with 100% oxygen.
9. Repeat this procedure as needed until the airway is clear.

**TRACHEAL SUCTIONING (Trach tube or endotracheal tube)**
1. Body substance isolation procedures must be used.
2. Assess the need for suctioning.
3. Oxygenate the patient prior to suctioning.
4. Select an appropriate size suction catheter.
   a. A soft flexible suction catheter or a “whistle tip” should be used.
   b. A yankauer or “tonsil tip” should NOT be used.
5. Prepare a cup of sterile water or saline to flush the catheter after suctioning and in between attempts.
6. While maintaining aseptic technique, quickly insert the catheter into the endotracheal or tracheal tube until it is at the desired depth.
7. Apply suction and withdraw the catheter using a gentle rotating motion. Suction no more than 15 seconds per attempt.
8. Immediately after each suction attempt, oxygenate the patient for thirty seconds with 100% oxygen.
9. Repeat this procedure as needed until the airway is clear.
KEY POINTS

- General
  - To maintain aseptic technique, keep the distal end of the catheter in the wrapper when not being used.
  - If the suction catheter needs to be set down between suction attempts, place it back inside its wrapper.
  - Patients who require assisted ventilations should be hyperventilated before and after every suction attempt.
  - DO NOT suction for more than 15 seconds per attempt.
  - DO NOT insert farther than the desired depth.
  - If a back boarded patient vomits, turn the board on its side and then suction.

- Oral Suctioning
  - If using a soft flexible suction catheter, determine the length by holding it against the patient’s face. Measure from the edge of the patient’s mouth to the tip of the ear lobe.
  - Patients with clenched teeth may need to be suctioned via the naso-tracheal route. Use a soft suction catheter only.

- Tracheal Suctioning
  - Even though endotracheal tubes isolate the trachea, if there is fluid present in the lower airway, oxygenation will be reduced.
  - There are many patients at home with tracheotomy tubes. These tubes tend to become obstructed because the patient cannot cough normally. EMS is often called when these tubes become obstructed.
  - This procedure should be performed with aseptic technique. Use an unopened sterile catheter for every patient.
  - Use the largest sized suction catheter that will fit down the endotracheal tube.
  - Estimate the length by looking at the distance between the end of the tube and the sternal notch. This approximates the level of the carina.
  - If tracheal secretions are extremely thick and unable to be removed, administer 2 - 3 ml of saline followed by 2 BVM ventilations and then perform suctioning.
AIRWAY / BREATHING

TRANSPORT VENTILATION DEVICES

Inclusion: This procedure applies to CONTROL only resuscitative ventilators for use during cardiac arrest

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Transport of an intubated or tracheostomy patient</td>
<td>• Pt. currently breathing with ventilation device</td>
<td>• Insufficient training</td>
</tr>
</tbody>
</table>

PROCEDURE

1. Confirm the placement of tube as per airway protocol.
2. Ensure adequate oxygen delivery to the ventilator device.
3. Pre-oxygenate the patient as much as possible with BVM.
4. Remove BVM and attach ventilation device.
5. Per instructions of device, set initial respiration values, respiratory rate, and volume.
7. If any worsening of patient condition, decrease in oxygen saturation, or any question regarding the function of the ventilator, remove and resume bag-valve ventilations.

IF THERE IS EVER ANY QUESTION ABOUT WHETHER OR NOT THE DEVICES IS VENTILATING CORRECTLY, REMOVE IT AND VENTILATE MANUALLY

USERS MUST RECEIVE TRAINING REGARDING THEIR SPECIFIC VENT DEVICE

KEY POINTS

• Transportation ventilators may be used on patients according to the manufacturer’s directions.
• It must be noted that this is a short-term adjunct, which must be always monitored to prevent tube displacement. If the patient begins to show any signs of further deterioration, the entire airway must be re-evaluated, and a bag-valve-mask should be used until the airway can be successfully stabilized.
PURPOSE
This procedure describes the appropriate methods to apply, operate, and discontinue the LUCAS CPR device in patients > 12 years of age requiring mechanical chest compression related to cardiac arrest.

INDICATIONS
1. The LUCAS may be used in patients 12 years of age and older who have suffered non-traumatic cardiac arrest, where manual CPR would otherwise be used.

CONTRAINDICATIONS
1. Patients < 12 years of age.
2. Patients suffering traumatic cardiac arrest or patients with obvious signs of traumatic injury.
3. Patients who do not fit within the device.
   a. Patients who are too large and with whom you cannot press the pressure pad down 2 inches.
   b. Patients who are too small and with whom you cannot pull the pressure pad down to touch the sternum

PLACEMENT
1. All therapies related to the management of cardiac arrest should be continued as currently defined in protocol
2. Initiate typical resuscitative measures
   a. Early defibrillation should be considered and provided as indicated based on clinical presentation.
   b. Manual chest compressions should be initiated immediately while the LUCAS device is being placed on the patient.
   c. Limit interruptions in chest compressions to 10 seconds or less.
   d. Do not delay manual CPR for the LUCAS. Continue manual CPR until the device can be placed.
3. While resuscitative measures are initiated, the LUCAS device should be removed from its carrying device and placed on the patient in the following manner.
   Backplate Placement
   • The backplate should be centered on the nipple line and the top of the backplate should be located just below the patient’s armpits. Placement should occur during a scheduled discontinuation of compressions [e.g., after five cycles of 30:2 or two minutes of uninterrupted compressions]].

Position the Compressor
• Turn the LUCAS Device on (the device will perform a 3 second self-test).

ON/OFF Switch
• Remove the LUCAS device from its carrying case using the handles provided on each side.
• With the index finger of each hand, pull the trigger to ensure the device is set to engage the backplate. Once this is complete, you may remove your index finger from the trigger loop.

• **Approach the patient from the side opposite the person performing manual chest compressions.**

• Attach the claw hook to the backplate on the side of the patient opposite that where compressions are being provided.

• Place the LUCAS device across the patient, between the staff member’s arms who is performing manual CPR.

• At this point the staff member performing manual CPR stops and assists attaching the claw hook to the backplate on their side.

• Pull up once to make sure that the parts are securely attached.

**Adjust the Height of the Compression Arm**

• Use two fingers (V pattern) to make sure that the lower edge of the Suction Cup is immediately above the end of the sternum. If necessary, move the device by pulling the support legs to adjust the position.

• Press the Adjust Mode Button on the control pad labeled #1. (This will allow you to easily adjust the height of the compression arm).

![Adjust Mode Button](image)

• To adjust the start position of the compression arm, manually push down the SUCTION CUP with two fingers onto the chest (without compressing the patient’s chest).

• Once the position of the compression arm is satisfactory, push the green PAUSE button labeled #2. (This will lock the arm in this position), then remove your fingers from the SUCTION CUP.

• If the position is incorrect, press the ADJUST MODE BUTTON and repeat the steps.

**Start Compressions**

• If the patient is not intubated and you will be providing compression to ventilation ratio of 30:2 push ACTIVE (30:2) button to start.

• If the patient is intubated and you will be providing continuous compressions push ACTIVE (continuous) button.

![ACTIVE BUTTON (Continuous)](image)

![ACTIVE BUTTON (30:2)](image)
Patient Adjuncts

- Place the neck roll behind the patient’s head and attach the straps to the LUCAS device.
  - This will prevent the LUCAS from migrating toward the patient’s feet.
- Place the patient’s arms in the straps provided.

**USING THE LUCAS DURING RESUSCITATION**

**Defibrillation**

- Defibrillation can and should be performed with the LUCAS device in place and in operation.
- One may apply the defibrillation electrodes either before or after the LUCAS device has been put in position:
  - The defibrillation pads and wires should not be underneath the suction cup.
  - If the electrodes are already in an incorrect position when the LUCAS is placed, you must apply new electrodes.
- Defibrillation should be performed according to the joint EMS protocols and following the instructions of the defibrillator manufacturer.
- If the rhythm strip cannot be assessed during compressions, one may stop the compressions for analysis by pushing the PAUSE BUTTON (The duration of interruption of compressions should be kept as short as possible and should not be > 10 seconds. There is no need to interrupt chest compressions other than to analyze the rhythm).
- Once the rhythm is determined to require defibrillation, the appropriate ACTIVE BUTTON should be pushed to resume compressions while the defibrillator is charging and then the defibrillator should be discharged.

**Pulse Checks / Return of Spontaneous Circulation (ROSC)**

- Pulse checks should occur intermittently while compressions are occurring.
- If the patient moves or is obviously responsive, the LUCAS Device should be paused, and the patient evaluated.
- If there is a change in rhythm, but no obvious indication of responsiveness or ROSC, a pulse check while compressions are occurring should be undertaken. If the palpated pulse is asynchronous, one may consider pausing the LUCAS Device. If the pulse remains, reassess the patient. If the pulse disappears, one should immediately restart the LUCAS Device.

**Disruption or Malfunction of Lucas Device**

- If disruption or malfunction of the LUCAS device occurs, immediately revert to Manual CPR.

**Care of the LUCAS Device after use**

- Remove the Suction cup and the Stabilization Strap (if used, remove the Patient Straps).
- Clean all surfaces and straps with a cloth and warm water with an appropriate disinfectant agent.
- Replace the used Battery with a fully charged Battery.
- Remount (or replace) the Suction Cup and straps.
- Repack the device into the carrying bag.
- Make sure that the Charging Cord is plugged into the LUCAS Device.
Automated CPR Device (AutoPulse)

INDICATIONS:
The AutoPulse is intended to be used as an adjunct to manual CPR, on adult patients only, in cases of clinical death as defined by a lack of spontaneous breathing and pulse. The AutoPulse must be used only in cases that manual CPR would normally be initiated. Personnel certified in manual CPR must always be present during AutoPulse operation.

CONTRAINDICATIONS:
- Patients with traumatic injury (wounds resulting from sudden physical injury or violence)
- Patients under the age of 18.
- Patient’s parameters that are not within the AutoPulse’s Operating Parameters.

KEY POINTS:
- The AutoPulse takes time to deploy. It is essential that providers begin manual CPR as soon as cardiac arrest is recognized and continue until the AutoPulse is deployed.
- If there is an error that causes the AutoPulse to stop performing CPR, if the band cannot be closed around the patient, or if the AutoPulse fails to start CPR, continue the resuscitation with manual CPR. Do not attempt to resolve the error until after patient care is complete.
- If the AutoPulse is stored in the Quick Case, the patient may be extricated using the carrying device built into the case. Otherwise, the AutoPulse must be secured to another approved extrication device to move the patient.
- Use of the AutoPulse does not change AHA recommendations for CPR. Use a ratio of 30 compressions to 2 ventilations on patients without an advanced airway and switch the AutoPulse to continuous compressions if an advanced airway is in place.
- Remove the AutoPulse from the patient by undoing the Velcro fastener, not by cutting the Life Band. Cutting the Life Band may cause an error that cannot be fixed in the field.

AutoPulse Operating Parameters:

<table>
<thead>
<tr>
<th>Patient Parameter</th>
<th>Auto Pulse Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Patient chest circumference permitted</td>
<td>29.9 to 51.2 in (76 to 130cm)</td>
</tr>
<tr>
<td>Patient chest width permitted</td>
<td>9.8 to 15 in. (25 to 38cm)</td>
</tr>
<tr>
<td>Maximum patient weight permitted</td>
<td>300lbs (136kg)</td>
</tr>
</tbody>
</table>

Deploying the AutoPulse System:

1. Power up the Auto Pulse. The ON/OFF button is located on the top (“head”) edge of the Auto Pulse Platform.
2. The Auto Pulse illuminates the green Power light-emitting diode (LED) on the User Control Panel and performs self-tests.
   **Note:** Make sure that no User Advisory, Fault or System Error messages display.
3. Sit the patient up and make a single cut down the back of the patient’s clothing.
4. Slide the Auto Pulse Platform into position behind the sitting patient and lay the patient down onto the platform. Placing the Auto Pulse to the patient’s side and “log rolling” him or her onto the platform is an acceptable alternative.
5. Grasp the Clothing by the sleeves and pull down toward the ankles to remove all the clothing from both the front and back torso. The anterior pad(s) may be placed at this time.
6. Position the patient so that he/she is centered laterally (from left to right) and that the armpits are aligned with the Auto Pulse using the yellow line positioning guides on the platform (see diagram at right).

7. Close the Life Band around the patient’s chest. To properly align the two sides of the Life Band:
   a) Place band on top of patient’s chest
   b) Locate mating slot of band over the alignment tab
   c) Press the bands together to engage and secure the Velcro fastener
   d) Lift the Life Band to its fullest, ensuring that the side bands are at a 90-degree angle to the platform, that they are not twisted and that there are no obstructions.
   e) Center the Life Band on the patient’s chest, placing it such that its center is over the area upon which manual compressions are conducted.

   **Note:** If the bands cannot be closed, use manual CPR.

**Starting Chest Compressions:**

1. Make sure that the yellow upper edge of the Life Band is aligned with the patient’s armpits and is directly over the yellow line on the Auto Pulse Platform. Also make sure that there are no obstructions, such as clothing, straps, or equipment, with the bands.
2. Press and release the Start / Continue button once. The Auto Pulse Automatically adjusts the bands to the patient’s chest.

   **Warning:** Do not touch the patient or the Life Band while the Auto Pulse Platform is analyzing the patient’s size.

3. The Auto Pulse will pause for 3 seconds to allow you to verify that the patient is properly aligned and that the Life Band has taken up any slack in the bands. **Note:** If the patient is not properly aligned, press Stop / Cancel button, realign the patient, and begin compressions again with step 1.
4. After the 2 second verify patient alignment pause is complete, compressions will automatically begin. You may press the Start / Continue button to immediately initiate compressions ahead of the time.

   **Warning:** If the Stop / Cancel button is not pressed within 3 seconds, compressions will automatically begin. Press the Stop/Cancel button to immediately stop the compressions.

**Compression Modes:**

- **30:2** – The AutoPulse will perform 30 compressions and then pause for 3 seconds to permit the user to ventilate the patient before automatically resuming compressions. The AutoPulse will be set to start in 30:2 mode and should be used in this mode whenever an advanced airway is not in place.
- **Continuous** – The AutoPulse will continually perform ventilations until the stop button is pressed. An audio
Removing Patient 2.

4. The current compression mode is displayed in the left upper corner of the screen. The words above the gray Menu / Mode switch button indicate the alternate mode the AutoPulse will switch to. Pressing the Menu / Mode switch once will indicate that you want to change compression modes. Press the Menu / Mode switch twice in rapid succession to confirm your compression change.

5. To access the patient or to pause the Auto Pulse for any reason, press the Stop / Cancel button. The Auto Pulse Platform releases the tension on the Life Band, allowing the user to pull the bands to the maximum extended position.

6. After either successful resuscitation or termination of activities, press the Stop / Cancel button followed by the On/Off button. The Stop / Cancel button action will cease the compression cycles and relax the Life Band. The On / Off button action will power down the Auto Pulse.

7. Open the Velcro fastener and lift or log roll off the patient from the Auto Pulse Platform, as necessary.

Patient Alignment and Securing for Transport:

**Warning:** The Auto Pulse is NOT intended for carrying or transporting a patient. The Auto Pulse should be secured to the top of a backboard or other equipment used to carry or transport the patient, if necessary. During Transport, Regular Checks of the patient’s alignment should be performed.

1. Attach the Shoulder Restraint to keep the patient properly aligned on the Auto Pulse Platform.
2. The head Immobilizer assists in keeping the patient’s head from moving, especially when combined with cervical collar. A cloth may also be placed under the patient’s head.

Removing the LifeBand:

**Note:** DO NOT cut the LifeBand before removing it from the AutoPulse. Cutting the LifeBand may cause the AutoPulse to report a fault and will require specific steps to clear the fault.

1. Place the AutoPulse platform with the surface facing down on a smooth, flat surface.
2. Flip up the hinged belt guards of the LifeBand cover plate to disengage the LifeBand from the rollers. You will hear the guards “snap.” This is normal.
3. Using both hands, pinch together the locking tabs of the LifeBand cover plate and firmly pull the plate straight up and away from the AutoPulse.
4. Remove the LifeBand from the AutoPulse by grasping the LifeBand chest band with the thumb and index finger of both hands, on either side if the LifeBand clip. Push the guide plate, using both middle fingers. Keeping the guide plate pushed in, pull up on the band to remove the clip from the shaft.

Removing a LifeBand that is cut or not in the home position:

**Warning:** The chest band must be completely unwound from the driveshaft before it is removed. When the chest band is completely unwound, the seam is visible and the driveshaft rests in the home position. Removing the band clip when the driveshaft is not in at its home position will result in a permanent User Advisory (45) that the user will not be able to clear. The LifeBand should only be removed from the driveshaft ONLY from its home position. If the chest bands have been cut it is quite possible that the chest band is still wound onto the driveshaft. Care should be taken to ensure that the bands are fully extended before the cover plate is opened and the band clip is removed.

1. Once the cover plate is removed, take hold of the chest band on either side of the driveshaft, and pull both bands outward.
2. The chest bands should now be fully extended. The seam securing the band clip should easily be seen and the driveshaft is centered. The LifeBand may now be removed using the removal procedures.
**PERIPHERAL INTRAVASCULAR ACCESS (IV)**

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| • Any patient where intravenous access is indicated (significant trauma or mechanism, emergent or potentially emergent medical condition) | • Dehydration  
• Hypovolemia  
• Need for drug therapy | • Hypersensitivity to IV catheter |

**PROCEDURES**

2. Prepare equipment.  
3. Inspect the IV solution for expiration date, cloudiness, discoloration, leaks, or the presence of particles.  
4. Connect IV tubing to the solution in a sterile manner. Fill the drip chamber half full and then flush the tubing bleeding all air bubbles from the line.  
5. Place a tourniquet around the patient’s extremity to restrict venous flow only.  
6. Select a vein and an appropriate gauge catheter for the vein and the patient’s condition.  
7. Prep the skin with an antiseptic solution.  
8. Insert the needle with the bevel up into the skin in a steady, deliberate motion until the blood flashback is visualized in the catheter.  
9. Advance the catheter into the vein. **Never** reinsert the needle through the catheter.  
10. Dispose of the needle into the proper container without recapping.  
11. Draw blood samples when appropriate.  
12. Remove the tourniquet and connect the IV tubing or saline lock.  
13. Open the IV to assure free flow of the fluid and then adjust the flow rate as per protocol or as clinically indicated.  
14. Secure IV using appropriate measures to insure stability of the line.  
15. Check for signs of infiltration.  
17. Document the procedure, time, and result on the patient care report (PCR).

**Attempt to draw lab work on all patients when the IV is started, unless the draw will compromise the access site, or the patient is in extremis.**  
**Label all blood draws with patient name and DOB**

**KEY POINTS**

• IVs will be started by the Advanced EMT and / or the Paramedic as allowed by each patient care protocol.  
• IV placement must not delay transport of any critical patient involved in trauma.  
• Generally, no more than two (2) attempts or more than two minutes should be spent attempting an IV. If unable to initiate IV-line, transport patient and notify hospital IV was not able to be started.  
• IVs may be started on patients of any age providing there are adequate veins and patient’s condition warrants an IV.  
• Use 1000 ml bags of normal saline for trauma patients and 500 - 1000 ml bags of normal saline for medical patients.  
• Any prehospital fluids or medications approved for IV use may be given through intraosseous access.  
• All IV rates should be at KVO (minimal rate to keep vein open) unless administering fluid bolus.  
• Extreme care should be made to discard of all IV sharps in the appropriate sharps container immediately after cannulation. No sharps should be found on patient / sheets after transport to the hospital.  
• Any venous catheter which has already been accessed prior to EMS arrival may be used.  
• Upper extremity IV sites are preferable to lower extremity sites.  
• Lower extremity IV sites are relatively contraindicated in patients with vascular disease or diabetes.  
• In post-mastectomy patients, avoid IV, blood draw, injection, or blood pressure in arm on affected side.  
• Use IV catheters appropriately sized for the patient and their condition.
PROCEDURE FOR STARTING SALINE LOCK

1. Prepare equipment: Flush saline lock with saline (approx. 1 ml) leave saline syringe attached device.
2. The initial attempt should be the dorsum of hand. Further attempts should proceed to the forearm; the antecubital fossa should not be used for saline locks.
3. Apply tourniquet.
4. Cleanse site with alcohol.
5. Use appropriately sized catheter for all saline locks. Perform venipuncture.
6. Attach IV tubing and push remaining saline through tubing and catheter. Remove syringe.
7. Secure IV using appropriate measures to insure stability of the line.
8. Check for signs of infiltration.

KEY POINTS

- Saline lock is preferred for patients who do not need immediate IV medication or fluids.
- Saline locks can be used whenever a patient requires an IV primarily for medication administration, or for any patient where the IV would be run at a TKO rate.
- A saline lock should not be used with a 14 -16 gauge IV unless attached to IV tubing and a bag or normal saline.
- Extreme care should be made to discard of all IV sharps in the appropriate sharps container immediately after cannulation. No sharps should be found on patient or in sheets after transport to the hospital.
- External jugular. (> 8 years of age).

Blood Draws
- Blood specimen drawing should be performed whenever the patient has a medical condition requiring an IV.
- Blood draws are not required if the IV site may become compromised, trauma, or the patient’s condition dictates otherwise.
- Blood tubes should be labeled with the patient’s name and initialized by the drawer of the specimen and placed in a biohazard bag.
- If the tube does not draw a vacuum, discard tube, and try another of the same color.
- Tube should be rotated upright, not shaken, when mixing additives and blood.
## EXTERNAL JUGULAR INTRAVASCULAR (IV)

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| • External jugular vein cannulation is indicated in a critically ill patient > 8 years of age who requires intravenous access for fluid or medication administration and in whom an extremity vein is not obtainable. Intraosseous access should be the preferred access route and attempted first. | • Dehydration  
• Hypovolemia  
• Need for drug therapy | • Only (1) attempt per pt.  
• Start IV Away from head, towards feet |
| • External jugular cannulation can be attempted initially in life threatening events where no obvious other peripheral site is noted. |          |          |

### PROCEDURE

1. Place the patient in a supine head down position. This helps distend the vein and prevents air embolism.
2. Turn the patient’s head toward the opposite side if no risk of cervical injury exists.
3. Position yourself at patient’s head.
4. Locate external jugular vein.
5. Select IV catheter.
6. Prep the site as per peripheral IV site.
7. Align the catheter with the vein and aim toward the same side shoulder.
8. “Tourniqueting” the vein lightly with one finger above the clavicle, puncture the vein midway between the angle of the jaw and the clavicle and cannulate the vein in the usual method.
9. Attach the IV and secure the catheter avoiding circumferential dressing or taping.
10. Secure IV using appropriate measures to insure stability of the line.
11. Check for signs of infiltration.
12. Adjust flow rate.

### KEY POINTS

- Hypotensive patients may not produce a good “flash” from their EJ vein.
- May use a syringe to aspirate blood on the back of the IV catheter to help establish patency.
- Flow a bolus of saline through EJ IV catheter to assure solid patency prior to administering medications through the line, especially dextrose or vasopressors.

---

ONLY (1) ATTEMPT SHOULD BE MADE DURING EXTERNAL JUGULAR IV  
DO NOT ATTEMPT AN IV ON THE OTHER SIDE OF THE NECK
ADULT INTRAOSEOUS INFUSION:

PROCEDURE: EZ IO Adult Device: (For providers trained in technique)

1. Select site:
2. **Humoral head**, outer aspect (use the 45 mm yellow needle) **OR Tibia** medial to the tibial tuberosity on flat plane of tibia (use 25mm blue or 45 mm yellow).
3. Locate the anatomical site and prep with betadine and / or alcohol.
4. Load the needle onto the driver.
5. Firmly stabilize the leg near (not under) the insertion site.
6. Firmly press the needle against the site at a 90° angle and operate the driver.
7. Use firm, gentle pressure.
8. As the needle reaches the bone, stop and be sure that the 5 mm marking on the needle is visible; if it is, continue to operate the driver.
9. When a sudden decrease in resistance is felt and the flange of the needle rests against the skin, remove the driver and remove the stylet from the catheter.
10. Do not attempt to aspirate bone marrow. (may clog needle and tubing)
11. Use a syringe to infuse 0.9% normal saline.
12. If no S/S of infiltration are found, attach the IV line, and infuse fluids and medications as normal. (IV bag will need to be under pressure)
13. Secure the needle and dress the site.
14. Manage IO pain with LIDOCAINE (XYLOCAINE) through the IO 20 – 40 mg. Allow to dwell in IO space. Approved for AEMT

Consider use of 45 mm length IO needle for patients with excessive tissue over the insertion site. Use the 45 mm needle for all humeral head insertions – see humeral head IO procedure.

PROCEDURE: Adult IO Manual Placement:

1. Expose the lower leg.
2. Identify the tibial tubercle (bony prominence below the kneecap) on the proximal tibia.
3. The insertion location will be 1 - 2 cm (2 finger widths) below this and medially.
4. Prep the site as per peripheral IV site.
5. Insert needle at 90-degree angle to the skin surface, approximately one to two finger breadths distal to the tibial tuberosity. With a straight steady push and / or rotary motion, push needle through subcutaneous tissue and bone until a drop or pop is felt.
6. Remove the trocar and attach the IV.
7. Once the needle has reached the bone marrow, saline should be injected via syringe to clear needle.
8. Observe for signs of subcutaneous infiltration.
9. The needle should feel firm in position and stand upright without support.
10. Stabilize and secure the needle.
11. Infusion via this route is the same as venous access without limit to rate of administration, drugs pushed or fluid type infused, pressure infuser may be necessary to facilitate flow.
13. Manage IO pain with LIDOCAINE (XYLOCAINE) through the IO 20 – 40 mg. Allow to dwell in IO space. Approved for AEMT
**PEDiATRIC iNTRAOSSEOUS INFUSION:**

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| • Life threatening illness or injury in a child where traditional vascular access has failed or is unlikely | • Unresponsive  
• Cardiopulmonary arrest  
• Decompensated shock | • Gross infection, osteomyelitis, or cellulitis at the intended site (use the other leg if possible)  
• Fracture at or above the intended site  
• Previous unsuccessful IO attempt in same extremity |

**PROCEDURE:** May use manual IO Device or EZ IO Pediatric Device

1. Select site.
2. Identify the tibial tubercle (bony prominence below the kneecap) on the proximal tibia or the humeral head. The insertion location will be 1-2 cm (2 finger widths) below this and medially.
3. Prep the site as per peripheral IV site.
4. Stabilize leg/shoulder as needed.
5. Needle insertion varies between 70- and 90-degree angle to the skin surface, approximately one to two finger breadths distal to the tibial tuberosity. With a straight steady push and/or rotary motion, push needle through subcutaneous tissue and bone until a drop or pop is felt.
6. Remove the trocar and attach the IV.
7. Once the needle has reached the bone marrow, saline should be injected via syringe to clear needle block.
8. Observe for signs of subcutaneous infiltration.
9. The needle should feel firm in position and stand upright without support.
10. Stabilize and secure the needle.
11. Infusion via this route is the same as venous access without limit to rate of administration, drugs pushed or fluid type infused, pressure infuser may be necessary to facilitate flow.
12. Document the procedure, time, and result on the patient care report (PCR).
13. Manage IO pain with LIDOCAINE (XYLOCAINE) through the IO 0.5 mg/kg, not to exceed 40 mg. Allow to dwell in IO space. Approved for AEMT

**KEY POINTS**

- An IO can administer any medication or fluid that can be administered by an IV.
- Consider using a three-way stopcock, and a syringe with the IV tubing. Use the “pull-push” method to infuse fluid for small bolus in infants/children.
- A blood pressure cuff or pressure infuser may have to be used to apply pressure to the IV bag to maintain an adequate flow rate.
- An IO may be attempted prior to attempting an IV if the patient is in cardiac arrest or is in decompensated shock and requires immediate access.
- If attempt unsuccessful remove needle and apply pressure to site for 5 minutes.
- Intraosseous infusions of fluids may cause subcutaneous infiltration, osteomyelitis, or subcutaneous infections if not placed properly.
**CIRCULATION / SHOCK**

**INTRAOSSEOUS INFUSION – Humeral Head**

<table>
<thead>
<tr>
<th>Adult or Pediatric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place the patient’s hand over the abdomen (elbow adducted and humerus internally rotated)</td>
</tr>
<tr>
<td>Place your palm on the patient’s shoulder anteriorly</td>
</tr>
<tr>
<td>- The area that feels like a “ball” under your palm is the general target area</td>
</tr>
<tr>
<td>- You should be able to feel this ball, even on obese patients, by pushing deeply</td>
</tr>
</tbody>
</table>

| Place the ulnar aspect of one hand vertically over the axilla |
| Place the ulnar aspect of the opposite hand along the midline of the upper arm laterally. |

| Place your thumbs together over the arm. |
| - This identifies the vertical line of insertion on the proximal humerus |

| Palpate deeply as you climb up the humerus to the surgical neck. |
| - It will feel like a golf ball on a tee – the spot where the “ball” meets the “tee” is the surgical neck |
| - The insertion site is on the most prominent aspect of the greater tubercle, 1 to 2 cm above the surgical neck |

| Insertion: |
| - Prepare the site by using antiseptic solution of your choice |
| - Use a clean, “no touch” technique |
| - Remove the needle cap |
| - Point the needle set tip at a 45-degree angle to the anterior plane and posteromedial |
| - Push the needle tip through the skin until the tip rests against the bone |
| - The 5mm mark must be visible above the skin for confirmation of adequate needle length |
| - Gently drill into the humerus 2cm or until the hub reaches the skin in an adult. |
| | - The hub of the needle set should be perpendicular to the skin |
| - Hold the hub in place and pull the driver straight off |
| - Continue to hold the hub while twisting the stylet off the hub with counterclockwise rotations |
| | - The needle should feel firmly seated in the bone (1st confirmation of placement) |
| - Place the stylet in a sharps container |
| - Place the EZ-Stabilizer™ dressing over the hub |
| - Attach a primed EZ-Connect® extension set to the hub, firmly secure by twisting clockwise |
| - Pull the tabs off the EZ-Stabilizer dressing to expose the adhesive, apply to the skin |
| - Aspirate for blood/bone marrow (2nd confirmation of placement) |
| - Secure the arm in place across the abdomen |
THIS PAGE INTENTIONALLY LEFT BLANK
The ResQGARD is an impedance threshold device (ITD) that provides therapeutic resistance to inspiration in spontaneously breathing patients. During inspiration, a negative pressure (created from expansion of the thorax) draws air into the lungs. When inspiratory impedance is added to the ventilation circuit, it enhances the negative pressure (vacuum) in the chest, which pulls more blood back to the heart, resulting in increased preload and thus, enhanced cardiac output on the subsequent cardiac contraction.

**Indications for Use:**
Spontaneously breathing patients who are experiencing symptoms of low blood circulation (e.g., diaphoresis, tachycardia, weak radial pulses, cold, clammy skin, tachypnea) or hypotension (e.g., < 90 mm Hg [adults]; per age & weight and as directed by a physician [children]), which can be secondary to a variety of causes such as; Anaphylaxis, Blood loss (traumatic or medical etiology) or blood donation, Burns, Dehydration, Dialysis, Drug overdose, Heat shock, Orthostatic intolerance, Pregnancy, Sepsis / toxins, and Spinal shock.

2. Permissive Hypotension: in cases (e.g., hemorrhage due to a trauma-related injury) in which a lower-than-normal blood pressure (BP) is desired to assist in the blood-clotting process, the ResQGARD may still be a reasonable therapy to help maintain “permissive hypotension.”

**Contraindications:**
1. Flail chest
2. Shortness of breath or respiratory insufficiency
3. Chest pain
4. Dilated cardiomyopathy
5. Congestive heart failure (Cardiogenic Shock)
6. Pulmonary hypertension
7. Aortic stenosis
8. Penetrating chest trauma

**Precautions:**
1. Children under 25 lbs. may not be cooperative enough to tolerate use of the ResQGARD.
2. The safety and effectiveness in persons suffering from arterial stenosis or asthma has not been established.
3. If respiratory distress develops during use of the ResQGARD, immediately discontinue use.
4. Do not leave the ResQGARD in the hands of untrained healthcare providers.
5. Nausea / Vomiting

**Procedure for Use:**
1. Identify the need for ResQGARD application (assess indication for use).
2. Reassure patient and position as appropriate.
3. Obtain baseline vital signs (pulse, respirations, blood pressure and oxygen saturation) and monitor cardiac rhythm.
4. Explain to the patient that the device will make it slightly more difficult to breathe, but that the resistance is what may make them feel better.
5. Gently (but firmly) hold the ResQGARD over the nose and mouth (or have the patient hold), establishing and maintaining a tight face seal with facemask. The head strap (e.g., ResQStrap) may be used if the patient does not want to hold the ResQGARD in place.
6. Have patient breathe in slowly (over 2 - 3 seconds) and deeply; exhale normally. Breathe at a rate of 10 – 16/minute.
7. If supplemental oxygen is used, attach the tubing to the oxygen port on the ResQGARD and deliver up to 15 lpm, but do not exceed 15 lpm.
8. If end tidal carbon dioxide (EtCO₂) monitoring is desired, attach the sensor to the exhalation port of the ResQGARD.
9. Reassess vital signs often (every 3 - 5 minutes).
10. Once the patient’s blood pressure has stabilized and risen to an acceptable level it is recommended that you continue ResQGARD treatment for approximately 5 minutes before discontinuing its use. Reapply if necessary if the blood pressure drops again.
11. Document ResQGARD therapy on patient care report (e.g., time initiated and discontinued, vital sign response).

**Special Patient Considerations:**
1. In a patient without intravenous [IV] access, applying the ResQGARD may make it easier to establish an IV because of the improvement in blood pressure.
2. The ResQGARD may be used in conjunction with other indicated treatments for hypotension (e.g., fluids, vasopressors, patient positioning).
3. In cases where the rate of blood loss is unclear, the recommendation is to use the ResQGARD as you would a fluid challenge in the field (i.e., if a fluid challenge is indicated, then the ResQGARD may be too).
Ventricular assist device patients (VAD) are special care situations. Unless these patients are in cardiac arrest they need to be transported to their VAD implantation center. Local or regional hospitals are not equipped to handle these patients.

**UNIVERSAL PATIENT CARE PROTOCOL**

**Determine if VAD is functioning**
- Auscultate chest and upper abdominal quadrants – Continuous Humming sound = pump is working

⚠️ Many pumps are non-pulsatile. Patient may not have palpable pulses, measurable BP, or Pulse Oximetry.

⚠️ Use other indicators of perfusion such as skin signs, mental status, and Capnography.

**Functioning**
- Do not ever shut off

**Not Functioning / Alarming**

**Find Accompanying Instructions for Device**
1. Page / call VAD team
2. Check that all Wires / Leads Connected to Controller / Power
3. Check Power Sources
4. Change Power Sources (Only change 1 battery at a time)
5. Attempt Re-start or Start in Backup Mode

**IF unable to Maintain Pump Operation**
- Follow VAD team instructions
- Treat for Cardiogenic Shock

**Patient Unstable**
- Treat Per Standard ACLS Protocols
  - Pacing OK
  - Defibrillation OK
  - ACLS drugs OK
  - Chest Compressions only as last resort
  - Manual chest compressions only, do not use automated chest compression devices

**Patient Stable**
- Treat Per Standard Medical Protocols

**TRANSPORT** to appropriate facility (Air Transport OK for VAD Patients)
- **CONTACT** receiving facility
- **CONSULT** Medical Direction where indicated
**AUTOMATED EXTERNAL DEFIBRILLATOR (AED)**

### INDICATIONS
- Non-traumatic cardiac arrest in patients > 8 years of age

### SIGNS AND SYMPTOMS
The patient must meet ALL the following criteria:
- Unresponsive
- Apneic
- Pulseless
- Weighs greater than 55 lbs
- Pediatric patients >8 years

### CONTRAINDICATIONS
- If patient is found in water, remove from water and dry patient thoroughly. Do not use an AED in an explosive atmosphere, extremely wet atmosphere, or on a metal surface
- If a medication patch is found, remove patch, and wipe clean before applying defibrillation pads
- Do not place defibrillation pads directly over patient’s implanted defibrillator
- Patients < 8 years of age require specific pediatric defibrillation equipment

### PROCEDURE
Establish that the patient is pulseless and apneic.
1. Perform CPR for (2) minutes.
2. Attach the defibrillation pads to the patient’s chest and connect the cables to the AED.
3. The sternum pad is to be attached to the patient’s upper right chest, to the right of the sternum on the mid-clavicular line.
4. The apex pad is to be attached to the patient’s lower left rib cage, laterally and beneath the left nipple.
5. Turn the unit ON and follow the voice prompts.
6. Rhythm analysis:
   - Do not have any patient contact while the AED analyzes.
   - Rhythm analysis should take approximately 9 - 13 seconds.
7. If the AED unit’s voice prompts advise that “no shock advised”:
   - Check for a pulse, if no pulse, continue CPR.
8. Visually check that no one is in contact with the patient and announce CLEAR.
9. Press the SHOCK button when advised to by the unit’s voice prompts:
10. Continue CPR for 2 minutes.
11. If the patient’s pulse has returned:
    - Insure that the patient has a patent airway and treat accordingly.
12. If the patient remains pulseless, continue use of CPR and AED.

### KEY POINTS
- Do not use the AED in cases of traumatic or hypovolemic cardiac arrest (unless driver involved in MVA is in cardiac arrest and is suspected of having an acute MI while driving).
- Resuscitation should be withheld in all cases where such efforts would be futile. Patients should be considered DOA and resuscitation should not be attempted in the following situations:
  - Refer to the Dead-on Arrival (DOA) Policy.
  - A valid (within the last 2 years) Do Not Resuscitate (DNR). Refer to the Advanced Directives – Do Not Resuscitate (DNR) Policy.
- Defibrillation cables should be inspected for damage and / or wear.
- Defibrillation pads should be routinely inspected to assure that they are within their expiration and are not opened.
- Assure that batteries are charged, and spares are available.
## CARDIAC DEFIBRILLATION (MANUAL)

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| - Cardiac arrest with ventricular fibrillation or pulseless ventricular tachycardia | The patient must meet ALL the following criteria  
  - Unresponsive  
  - Apneic  
  - Pulseless | - If patient is found in water, remove from water and dry patient thoroughly. Do not use an AED in an explosive atmosphere, extremely wet atmosphere, or on a metal surface  
- If medication patch found, remove patch, and wipe clean before applying defibrillation pads  
- Do not place defibrillation pads directly over patient’s implanted defibrillator  
- Pediatric patients < 8 years of age require specific pediatric monitoring equipment |

### PROCEDURES

1. Establish that the patient is pulseless and apneic.
2. Provide (2) minutes of CPR.
3. Attach defibrillation pads and cables. Plug cable into EKG monitor.
4. Recognize EKG findings as ventricular fibrillation or pulseless ventricular tachycardia.
5. Charge the device to 360 J or recommended charge.
6. Visually check that no one is in contact with the patient and announce CLEAR.
7. Press the SHOCK button and deliver the shock.
8. Resume CPR for (2) minutes.
9. Check monitor for changes in rhythm. Check pulse.
10. If no change in rhythm repeat steps 5 - 8.
11. If EKG reveals change in findings, treat with the appropriate ACLS Protocol.

### Electrical Vector Change

A electrical vector (direction) change may be considered where a patient is refractory to defibrillations with the initial defibrillator pad placement.  
If initial pad placement is apex / sternum, consider anterior / posterior placement, and vice versa.  
Alternate between defibrillation pads by changing the defibrillation therapy cable between the pads sets for therapeutic effect.

### Double Sequential Defibrillation

For situations where a second defibrillator is immediately available and AT LEAST 4 previous defibrillations have failed.

1. Apply 2 defibrillators per typical measures.
2. One set of pads standard apex / sternum placement.
3. One set of pads anterior / posterior placement.
4. Charge BOTH defibrillators to highest joule setting.
5. ONE PERSON clears patient and SIMULTANEOUSLY presses shock buttons on BOTH defibrillators.
**12 - LEAD CARDIAC MONITORING**

<table>
<thead>

**Placement of the “V” Leads**  
**LEFT SIDE EKG**  
V1: 4th ICS – right of the sternum  
V2: 4th ICS – left of the sternum  
V3: Between V2 and V4  
V4: 5th ICS midclavicular LEFT  
V5: Between V4 and V6  
V6: Even with V4 midaxillary

**Placement of the “V” Leads**  
**RIGHT SIDE EKG**  
V1: 4th ICS – right of the sternum  
V2: 4th ICS – left of the sternum  
V3: Between V2 and V4  
RV4: 5th ICS midclavicular RIGHT  
V5: Between V4 and V6  
V6: Even with V4 midaxillary

---

1. Follow the Universal Patient Care Protocol.  
2. Place the patient in a position of comfort and explain the procedure.  
3. Apply the Limb and V Leads to the patient, protecting patient privacy.  
4. Enter patient information.  
5. Avoid patient movement and disturbance of EKG Leads.  
6. Press 12 – LEAD button. Allow monitor to analyze, interpret, and print rhythm strip.  
7. Make appropriate connections to transmission device and press TRANSMIT button to send EKG rhythm strip to hospital.

**KEY POINTS**

• A 12-Lead EKG should be performed on any patient with a complaint that may be cardiac in origin.  
• Protect the patient’s modesty.  
• The 12-Lead ECG should be acquired prior to medication administration (except oxygen) and extrication of the patient.  
• If the patient is having an acute MI, contact the receiving hospital as soon as possible.  
• The paramedic should give one copy of the 12-Lead EKG to the ED physician/nurse immediately upon your arrival and attach a second copy to the run report.  
• EKG adhesive patches should remain on the patient for consistent lead placement with follow up EKGs but should be removed before defibrillation patches are applied if necessary.  
• The monitor should remain on the patient for continuous cardiac monitoring enroute.

**TREATMENT DECISIONS ARE NOT TO BE BASED ON COMPUTERIZED EKG INTERPETATIONS**

Any adult medical patient or patients of any age with a cardiac history, irregular pulse, unstable blood pressure, dyspnea, chest pain, medication administration, or venous access must be placed on a cardiac monitor. Where clinically indicated, obtain a 12-lead EKG, and transmit to the emergency department. The transmission must include the patient’s name, age, and sex.

**EMTS AND AEMTS ARE EXPECTED TO PLACE LEADS ON THE PATIENT TO OBTAIN AND TRANSMIT A 12-LEAD EKG TO THE HOSPITAL IN THE ABSENCE OF A PARAMEDIC.**  
**EMT AND AEMTS ARE NOT PERMITTED TO INTERPET THE EKG.**
INDUCED HYPOTHERMIA (IH)

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| • Patents who have experienced ROSC after VFIB, Vtach, or witnessed asystole | • Post cardiac arrest | • Pregnancy  
• Traumatic Arrest  
• Preexisting Hypothermia  
• Known Hypovolemia |

Patient is to be cooled by direct application of cooling devices to the patient.  
Active cooling with cold saline is not permitted.

CHEMICAL COLD PACKS OR ICE PACKS
Place cold packs on the groin are on top of bilateral femoral circulation  
Place cold packs in the axilla bilaterally  
Place cold packs on neck bilaterally or cooling collar

CRYOCOLLAR
The Cryo Cooling System is a single use device to induce mild cerebral therapeutic hypothermia. This system is composed of a unique collar with a specialized door that works in conjunction with the Excel Cryo Cooling Elements, properly aligning the Excel Cryo Cooling Element with the patient’s carotid triangle. Heat is extracted from the blood as it passes through the arteries inducing mild hypothermia.

PROCEDURE
1. Place the collar on the person neck as you would any other C-Collar  
2. Once the collar is properly placed on the patient, the Excel Cryo Cooling Element must be activated. (Manufacture supplied cold pack)  
3. Once activated, open the collar door, and insert the Excel Cryo Cooling Element  
4. The Excel Cryo Cooling Element should be replaced every 20 minutes.  
5. Cooling should be maintained throughout transport of the ROSC patient
Certa Dose PALS Syringe Holder Kit
Preparation of PALS Syringe Holder Kit Task Completion

Patient Weight Estimation
1. Confirms patient is on their back, legs fully extended
2. Places the end of the Length-Based Resuscitation Tape, labeled "Measure from This End", next to the top of the patient’s head
3. Fully extends the Length-Based Resuscitation Tape beyond the heels of the patient and notes the correct color zone relative to the patient’s heels

Drug and Dosing Device Selection and Preparation
4. Confirms the correct drug and syringe (Bristoject-style) is selected for use in administration
5. Selects the Syringe Holder that matches the drug selected in Step 5 by reviewing the Drug Confirmation Label, and removes the Drug Confirmation Label
6. Slides the Syringe Holder on the injector until it snaps in place; Confirms flanges of Syringe Holder and injector are in direct contact or as close together as possible with Holder affixed
7. Correctly applies Baseline Reference Label to the top of the drug vial just below the vial cap
8. Removes protective caps from drug vial and base of injector
9. Threads vial into injector to assemble the syringe without pushing vial out of alignment
10. Confirms the syringe is assembled according to manufacturer’s instructions
11. Re-confirms that the attached Syringe Holder matches the drug to be administered by comparing the color-coded label on the Syringe Holder to the selected drug
12. Removes the syringe’s luer-cap
13. Expels the air; depresses the vial until stopper aligns with the zero line on the vial
14. Confirms the Baseline Reference Label is aligned with the baseline on the Syringe Holder
15.(a) If applicable: If the Baseline Reference Label line is below the baseline on the Syringe Holder, the provider gently pushes vial and expels medication until baselines align (as expected in Step 16 above)
15.(b) If applicable: If the Baseline Reference Label line is above the baseline on the Syringe Holder, the provider either uses the Bristoject-style device per its manufacturer’s instructions, or restarts the exercise with an unused Certa Dose PALS Syringe Holder Kit
16. Determines and communicates the patient’s color zone on the Syringe Holder (must match color zone determined in Steps 3 & 4)

Drug Administration
17. Correctly delivers the first dose using the first dose range (labeled with number 1) as a visual aid to confirm the desired volume on the Bristoject vial is administered
18. Correctly delivers the second dose using the second dose range (labeled with number 2) as a visual aid to confirm the desired volume on the Bristoject vial is administered
19. If applicable: Correctly delivers the third dose using the third dose range (labeled with number 3) as a visual aid to confirm the desired volume on the Bristoject vial is administered
20.(a) If applicable (i.e., additional epinephrine): Administers additional doses correctly with a new holder starting at Step 5, above
20.(b) Upon completion of administration, disposes of all medical waste per facility’s protocol
CARDIAC / ACLS
SYCHRONIZED CARDIOVERSION (MANUAL)

INDICATIONS | SIGNS AND SYMPTOMS | CONTRAINDICATIONS
---|---|---
- Unstable patient with a tachydysrhythmia  
- Patient is not pulseless
- Symptomatic narrow complex tachycardia  
- Symptomatic wide complex tachycardia  
- Grossly symptomatic atrial fibrillation  
- Grossly symptomatic atrial flutter
- A pulseless patient

PROCEDURE
1. Apply limb leads
2. Consider sedation with versed or valium prior to administering synchronized cardioversion.
3. Attach defibrillation pads to the patient and monitor.
4. Push the SYNC button.
5. Observe the EKG rhythm. Confirm that the triangle sense marker appears near the middle of each QRS complex.
6. If the sense markers do not appear or they are displayed in the wrong location adjust the EKG size or select another lead.
7. The location of the sense marker may vary slightly with each QRS complex.
8. Rotate the ENERGY SELECT dial and select the proper setting as required by protocol.
9. Push the CHARGE button.
10. Make sure that everyone is clear of the patient.
11. After confirming that the monitor is still in SYNC mode, push and hold the SHOCK button until it discharges.
12. Reassess the patient and the cardiac rhythm. Repeat steps 4 - 9 as indicated by the protocol.

KEY POINTS
- When attempting to cardiovert, double check to make sure that the SYNC button is ON.
- Monitor the patient for ventricular fibrillation.
- If the patient converts into ventricular fibrillation or pulseless ventricular tachycardia, reassess the patient. Immediately defibrillate the patient at and refer to the Ventricular Fibrillation / Pulseless Ventricular Tachycardia Protocol and treat accordingly.
- If the SHOCK button is not pushed, the energy will be internally removed. It will be necessary to recharge to the indicated energy setting.
- When synchronized cardioverting a patient, there may be a delay from when the button is depressed to when the shock is delivered.
- Use EXTREME caution in patients with rapid atrial fibrillation or atrial flutter. Cardioversion of these patients is associated with high risk of embolus. Prehospital cardioversion of these patients is reserved for life-threatening situations only.
TRANSCUTANEOUS PACING

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| • Patients with symptomatic bradycardia after no response to atropine or primary treatment if unable to start an IV  
• Pediatric patients requiring external transcutaneous pacing require the use of pads appropriate for pediatric patients per the manufacturer’s guidelines | • Adult bradycardia with severe hemodynamic compromise.  
• Symptomatic bradycardia that is refractory to pharmacological intervention.  
• Symptomatic 2nd or 3rd degree heart block | • Hypothermia |

PROCEDURE

1. Apply limb leads  
2. Consider sedation with Midazolam (Versed) or Lorazepam (Ativan) prior to administering transcutaneous pacing.  
3. Attach defibrillation / pacing pads to the patient and monitor.  
4. Place the defibrillation / pacing pads anterior-posterior or anterior-lateral.  
5. Do not place the pacing patches over the sternum, spine, or nipple.  
6. Push the PACER button.  
7. Push the RATE button.  
8. Push the CURRENT button and increase the milliamps until you reach electrical and mechanical capture (assess the carotid or femoral pulses to confirm mechanical capture).  
9. Hold the PAUSE button to stop the pacing so you can assess the patient’s underlying rhythm.  
10. Push the EVENT button to quick log CPR, medication administration, ETT placement etc.

Start at pacing rate of 60 beats per min (PPM on device).  
Increase milliamps until electrical capture, verify mechanical capture with femoral or radial pulses, blood pressure, and capnography.  
Increase milliamps a minimum of 10 to maintain capture during transport.

KEY POINTS

• The pacing will begin immediately once the pacer is turned on.  
• Monitor the patient for ventricular fibrillation.
### BLOOD GLUCOSE ANALYSIS

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Patients with suspected hypoglycemia (diabetic emergencies, change in mental status, bizarre behavior, etc.)&lt;br&gt;• Medical alert tags&lt;br&gt;• Drug / toxic ingestion</td>
<td>• Decreased mental status&lt;br&gt;• Change in baseline mental status&lt;br&gt;• Bizarre behavior&lt;br&gt;• Hypoglycemia (cool, diaphoretic skin)&lt;br&gt;• Hyperglycemia (warm, dry skin; fruity breath; Kussmaul breathing; signs of dehydration)</td>
<td>• Insufficient training</td>
</tr>
</tbody>
</table>

### PROCEDURE

1. Gather and prepare equipment.<br>2. Blood samples for performing glucose analysis shall be obtained from finger stick.<br>3. Place correct volume of blood in / on the glucometer per the manufacturer's instructions.<br>4. Time the analysis as instructed by the manufacturer.<br>5. Document the glucometer reading and treat the patient as indicated by the analysis and protocol.<br>6. Repeat glucose analysis as indicated for reassessment after treatment and as per protocol.

### KEY POINTS

- Exam: Mental Status, HEENT, Skin, Heart, Lungs, Abdomen, Back, Extremities, Neuro<br>- Be aware of AMS as presenting sign of an environmental toxin or Haz-Mat exposure and protect personal safety.<br>- It is safer to assume hypoglycemia than hyperglycemia if doubt exists.<br>- Do not let alcohol confuse the clinical picture. Alcoholics frequently develop hypoglycemia.<br>- Low glucose (< 70), normal glucose (70 - 120), high glucose (> 250)<br>- Consider restraints if necessary for patient's and / or personnel's protection per the restraint procedure.<br>- Glucometers must be calibrated and coded for the appropriate glucose strips following manufacturer and department recommendations or policies.<br>- Know the read range of the device you are using. “LO” and “HI” values vary between manufactures.
**MEDICAL**

**MEDICATION INJECTIONS**

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• When medication administration is necessary, and the medication must be given via the SQ or IM route or as an alternative route in selected medications</td>
<td>• Determined per protocol</td>
<td>• Allergy to medication per protocol</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Aspiration of blood</td>
</tr>
</tbody>
</table>

**INTRAMUSCULAR – EMT MAY PROVIDE IM INJECTION BY APPROVED AUTOINJECTOR ONLY**

**PROCEDURE**

1. Receive and confirm medication order or perform according to standing orders.
2. Prepare equipment and medication expelling air from the syringe.
3. Explain the procedure to the patient and reconfirm patient allergies.
4. The possible injection sites for intramuscular injection include the arm, buttock, and thigh. Injection volume should not exceed 1 ml for the arm and not more than 2 ml in the thigh or buttck.
5. The thigh should be used for injections in pediatric patients and injection volume should not exceed 1 ml.
6. Expose the selected area and cleanse the injection site with alcohol.
7. Hold intramuscular syringe at 90-degree angle, with skin pinched and flattened.
8. Insert the needle into the skin with a smooth, steady motion.
10. Inject the medication.
11. Withdraw the needle quickly and dispose of properly without recapping.
12. Apply pressure to the site.
13. Monitor the patient for the desired therapeutic effects as well as any possible side effects.

**SUBCUTANEOUS**

**PROCEDURE**

1. Receive and confirm medication order or perform according to standing orders.
2. Prepare equipment and medication expelling air from the syringe.
3. Explain the procedure to the patient and reconfirm patient allergies.
4. The most common site for subcutaneous injection is the arm. Injection volume should not exceed 1 ml.
5. The thigh should be used for injections in pediatric patients and injection volume should not exceed 1 ml.
6. Expose the selected area and cleanse the injection site with alcohol.
7. Hold subcutaneous syringe at 45-degree angle.
8. Insert the needle into the skin with a smooth, steady motion.
10. Inject the medication.
11. Withdraw the needle quickly and dispose of properly without recapping.
12. Apply pressure to the site.
13. Monitor the patient for the desired therapeutic effects as well as any possible side effects.
MEDICAL PROCEDURES

MUCOSAL ATOMIZATION DEVICE (MAD)

INDICATIONS

- Used for atomizing topical solutions across the nasopharyngeal and oropharyngeal mucous membranes.
- For use when administering the following medications:
  - Lorazepam (Ativan) for seizures / sedation – AEMT / PARAMEDIC USE ONLY
  - Midazolam (Versed) for seizures / sedation - AEMT / PARAMEDIC USE ONLY
  - Naloxone (Narcan) for opiate overdoses – APPROVED FOR EMT USE
  - Fentanyl (Sublimaze) for analgesia - AEMT / PARAMEDIC USE ONLY

PROCEDURE

1. Disconnect MAD from the included syringe and/or retrieve a needless syringe.
2. Attach needle to syringe.
3. Fill syringe with the desired volume of solution and eliminate remaining air.
4. Remove needle and dispose of appropriately.
5. Connect the MAD to the syringe.
6. Place the MAD tip in the nostril or oropharyngeal cavity.
7. Compress the syringe plunger to spray atomized solution into the nasal or oropharyngeal cavity.
8. Re-use the MAD on the same patient as needed, then discard.

KEY POINTS

The following are some of the benefits of IN (Atomized) drug delivery for the patient and provider:

- Eliminated the risk of a contaminated needlestick to the EMS provider.
- Simple and convenient for the EMS provider.
- Less frightening for children.
- Disposable.
- Discomfort is minimized for the patient.
- Serum levels of many IN administered medications are comparable to injected medications and much improved over rectal and oral routes.

Studies have shown that the most effective method to deliver a medication through the IN route is to atomize it across the nasal mucosa. Atomized particles (10 to 50 microns) adhere to the nasal mucosa over a large surface area, preventing waste and improving absorption of the medication. Administer half the dose in each nostril to increase the surface area, and further improve absorption.
## ORTHOSTATIC BLOOD PRESSURE MEASUREMENT

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Patient situations with suspected blood / fluid loss / dehydration</td>
<td>• Abdominal Pain</td>
<td>• Prepare for patient being unsteady on feet</td>
</tr>
<tr>
<td>• Patients &gt; 8 years of age, or patients larger than the Broselow tape</td>
<td>• Dizziness</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Pregnancy</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Syncope</td>
<td></td>
</tr>
</tbody>
</table>

### PROCEDURE

1. Assess the need for orthostatic blood pressure measurement.
2. Obtain patient’s pulse and blood pressure while supine.
3. Have patient stand for one minute.
4. Obtain patient’s pulse and blood pressure while standing.
5. If pulse has increased by 20 BPM or systolic blood pressure decreased by 20 mmHg, the orthostatic measurements are considered positive.
6. If patient is unable to stand, orthostatic measurements may be taken while the patient is sitting with feet dangling.
7. If positive orthostatic changes occur while sitting, DO NOT continue to the standing position.
8. Document the time and vital signs for supine and standing positions on the patient care report.
9. Determine appropriate treatment based on protocol.
# PAIN ASSESSMENT

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
</table>
| - Injury or illness requiring pain management. | - Abdominal pain  
- Chest pain secondary to infarction or angina  
- Acute urinary retention  
- Fractures  
- Severe burns  
- Kidney stones  
- Musculoskeletal trauma | - Altered level of consciousness  
- Head injuries  
- Chest injuries (blunt or penetrating)  
- Intoxication  
- Maxillofacial injuries  
- Psychiatric problems  
- Pediatric patients under 12 years of age  
- Pregnancy  
- Respiratory distress / failure |

## PROCEDURE

1. Initial and ongoing assessment of pain intensity and character is accomplished through the patient’s self-report.
2. Pain should be assessed and documented during initial assessment, before starting pain control treatment, and with each set of vitals.
3. Pain should be assessed using the appropriate approved scale.
4. Two pain scales are available: the 0 - 10 and the Wong - Baker “faces” scale.
5. 0 - 10 Scale: the most familiar scale used by EMS for rating pain with patients. It is primarily for adults and is based on the patient being able to express their perception of the pain as related to numbers. Avoid coaching the patient; simply ask them to rate their pain on a scale from 0 to 10, where 0 is no pain at all and 10 is the worst pain ever.
6. Wong - Baker Faces scale: this scale is primarily for use with pediatrics but may also be used with geriatrics or any patient with a language barrier. The faces correspond to numeric values from 0-10. This scale can be documented with the numeric value or the textual pain description.

## SEVERE PAIN MANAGEMENT

### KEY POINTS

- Pain is an unpleasant sensory and emotional experience associated with actual or potential tissue damage.
- Pain is subjective (whatever the patient says it is).

**The Wong-Baker Faces Pain Rating Scale**

Designed for children aged 3 years and older, the Wong-Baker Faces pain rating scale is also helpful for elderly patients who may be cognitively impaired. It offers a visual description for those who do not have the verbal skills to explain how their symptoms make them feel.

![Wong-Baker Faces Pain Rating Scale](image)

To use this scale, you should explain that each face shows how a person in pain is feeling. That is, a person may feel happy because he or she has no pain (hurt), or a person may feel sad because he or she has some or a lot of pain.

**A Numerical Pain Scale**

A numerical pain scale allows you to describe the intensity of your discomfort in numbers ranging from 0 to 10 (or greater, depending on the scale). Rating the intensity of sensation is one way of helping your doctor determine treatment. Numerical pain scales may include words or descriptions to better label your symptoms, from feeling no pain to experiencing excruciating pain. Some researchers believe that this type of combination scale may be most sensitive to gender and ethnic differences in describing pain.
### MEDICAL

#### PATIENT RESTRAINT

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>CONTRAINDICATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Patient out of control and may cause harm to self or others.</td>
<td>- Head Trauma</td>
<td>- None if warranted</td>
</tr>
<tr>
<td>- Necessary force required for patient control without causing harm</td>
<td>- Alcohol / drug related problems</td>
<td></td>
</tr>
<tr>
<td>- Immobilization of an extremity for transport to secure medically necessary</td>
<td>- Metabolic disorders (i.e., hypoglycemia, hypoxia, etc.)</td>
<td></td>
</tr>
<tr>
<td>devices such as intravenous catheters</td>
<td>- Psychiatric/stress related disorders</td>
<td></td>
</tr>
</tbody>
</table>

### KEY POINTS

- Soft restraints are to be used only when necessary in situations where the patient is potentially violent and may be of danger to themselves or others. EMS providers must remember that aggressive violent behavior may be a symptom of medical conditions.
- Patient health care management remains the responsibility of the EMS provider. The method of restraint shall not restrict the adequate monitoring of vital signs, ability to protect the patient’s airway, compromise peripheral neurovascular status or otherwise prevent appropriate and necessary therapeutic measures. It is recognized that evaluation of patient vital parameters requires patient cooperation and thus may be difficult or impossible.
- All restraints should have the ability to be quickly released, if necessary.
- Restraints applied by law enforcement (i.e., handcuffs) require a law enforcement officer to remain available to adjust restraints as necessary for the patient’s safety. This policy is not intended to negate the need for law enforcement personnel to use appropriate restraint equipment to establish scene control.
- Patients shall not be transported in a face down prone position to endure adequate respiratory and circulatory monitoring and management.
- Restrained extremities should be monitored for color, nerve and motor function, pulse quality and place mask on patient for body secretion protection. May use TB mask, or non-rebreather if patient needs oxygen.
- Use supine or lateral positioning ONLY.
- Neurovascular checks are required every 15 minutes.
- DOCUMENT all methods used.
NORMAL CHILDBIRTH

**INDICATIONS**
- Imminent delivery with crowning

**SIGNS AND SYMPTOMS**
- Urge to push
- Visible crowning

**CONTRAINDICATIONS**
- See Gynecological Emergencies Protocol

**PROCEDURE**

1. Delivery should be controlled to allow a slow controlled delivery of the infant. This will prevent injury to the mother and infant.
2. Support the infant’s head as needed.
3. Check the umbilical cord surrounding the neck. If it is present, slip it over the head. If unable to free the cord from the neck, double clamp the cord and cut between the clamps.
4. Suction the airway with a bulb syringe. Mouth then nose.
5. Grasping the head with hands over the ears, gently pull down to allow delivery of the anterior shoulder.
6. Gently pull up on the head to allow delivery of the posterior shoulder.
7. Slowly deliver the remainder of the infant.
8. Clamp the cord 2 inches from the abdomen with 2 clamps and cut the cord between the clamps.
9. Record APGAR scores at 1 and 5 minutes.
11. The placenta will deliver spontaneously, within 5-15 minutes of the infant. Do not force the placenta to deliver. Contain all tissue in plastic bag and transport.
12. Massaging the uterus may facilitate delivery of the placenta and decrease bleeding by facilitating uterine contractions.
13. Continue rapid transport to the hospital.
STROKE TELEMEDICINE

EMT Intervention  AEMT Intervention  PARAMEDIC Intervention  MED CONTROL Consult
**KEY POINTS**

- Vacuum mattresses may be used for major findings patients, but backboards alone may be harmful. Neutral placement on a cot mattress or a Reeves stretcher with a cervical collar is sufficient if a vacuum mattress unavailable.

- Backboards and KED’s can still be used for extrication.

- If a backboard is used for extrication, the patient may be left on the board during transport as situationally required.

- If a vacuum mattress is used, place a sheet over the mattress prior to placement of the patient on the device.

- If a vacuum mattress is used, a backboard may be used underneath to provide additional support as required.

- Never leave patients alone if they are collared and supine. Be prepared to turn the patient while maintaining manual in line stabilization of the spine if the patient begins to vomit to maintain their airway.

- Penetrating trauma does not require cervical motion restriction unless there is evidence of focal neurological deficits.

- Document thoroughly the decision process and the assessment findings for treatment decision(s).

- Patients shall not be aided to stand then sit on a backboard during extrication. Non-ambulatory patients shall be properly extricated to a backboard or with the use of a KED.

- Mental Status (AVPU), Glasgow Coma Scale (GCS), and thorough documentation of Motor, Sensory, and Pulses (MSP’S) are required to support treatment decisions.

- Mental status defects despite origin will be treated as equal, whether drug, alcohol, traumatic, chronic brain dysfunction, or otherwise.
TRAUMA

HELMET REMOVAL

<table>
<thead>
<tr>
<th>REMOVAL OF HELMET</th>
<th>LEAVE HELMET IN PLACE</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Inability to access, assess and maintain airway and breathing</td>
<td>• Helmet fits well with little or no movement of head in</td>
</tr>
<tr>
<td>• Improperly fitted helmet allowing for excessive head movement within helmet</td>
<td>helmet</td>
</tr>
<tr>
<td>• Proper C-spine alignment and immobilization cannot be achieved</td>
<td>• No impending airway or breathing problems</td>
</tr>
<tr>
<td>• Cardiac arrest</td>
<td>• Removal may cause further injury</td>
</tr>
<tr>
<td>• EMTs are trained in technique</td>
<td>• Proper C-spine alignment and immobilization can be</td>
</tr>
<tr>
<td></td>
<td>achieved with helmet in place</td>
</tr>
<tr>
<td></td>
<td>• There is no interference with the ability to assess and</td>
</tr>
<tr>
<td></td>
<td>reassess airway and breathing</td>
</tr>
</tbody>
</table>

KEY POINTS

Helmet Types:

1. Sport (Football, Ice Hockey, Field Hockey, Fencing, Baseball)
   - Typically, open anteriorly
   - Easier to access airway
   - If shoulder pads are used in conjunction with helmet and helmet is removed, then shoulder pads need to be removed simultaneously for proper C-spine alignment.

2. Motorcycle / Bike / Skateboarding
   - When full-faced, airway is harder to access and maintain.
   - Face shield may be removed for airway access.

SPORTS HELMETS PROCEDURE:

1. Most fit athlete tightly, especially football. They should be left in place.
2. All are equipped to have face piece removed separate from helmet. In most cases, removal of facemask is all that is needed, as the alignment of c-spine can be done with shoulder pads and helmet in place.
3. Removal of facemask may be done by cutting snubber straps that hold it in place to access airway.

Removal:

- If helmet must be removed due to unusual circumstances, at least 4 people are needed.
- Shoulder pads need to simultaneously be removed. (When shoulder pads are involved is to use forearms to stabilize helmet and place hands at base of neck grasping the shoulder area).
- **While maintaining manual c-spine**, Helmet’s inside face pads may be loosened by use of a tongue blade to un snapping them with a twisting motion. Then cut the shoulder pads laces and straps and all shirts and jerseys from end of sleeve to center to allow for quick removal.
- Lift patient flat up for removal of equipment. Helmet should be grasped and tilted slightly to remove – **DO NOT SPREAD SIDES OR BACK EDGE OF HELMET, WILL IMPINGE UPON NECK**.
- At same lift, pull off shoulder pads and clothing.
- Lower patient down and apply c-collar.

MOTORCYCLE / BIKE / SKATEBOARDING HELMETS PROCEDURE:

1. Usually do not fit tightly and may allow movement of head inside helmet.
2. If head can move, no c-spine immobilization is possible.
3. Some have separate face piece that can be moved for airway access.
4. Some have full face design that is not moveable where chin section is a rigid continuation of the helmet.
5. C-spine alignment difficult due to no shoulder padding. Must create pad to form straight alignment.
6. If unable to secure c-spine of airway, the helmet should be removed at the scene.
Removal:

- Take eyeglasses off before removal of the helmet.
- One EMT stabilizes the helmet by placing hands on each side of the helmet with fingers on mandible to prevent movement.
- Second EMT removes any straps by cutting them.
- Second EMT places one hand on the mandible at the angle of the jaw and the other hand posteriorly at the occipital region.
- The EMT holding the helmet pulls the sides of the helmet outwards away from the head and gently slips the helmet halfway off and stops.
- The EMT maintaining stabilization of the neck repositions hold by sliding the posterior hand superiorly to secure to head from falling back after complete helmet removal.
- Helmet is then completely removed.
**BLEEDING / HEMORRHAGE CONTROL**

**TOURNAQUET**

**INDICATIONS**

- The tourniquet is a device which is used for life threatening appendage hemorrhage that cannot be controlled with direct pressure and conventional bandaging techniques.

**PROCEDURE**

1. Place the device around the injured appendage above the level of bleeding. Place two tourniquets around lower extremities, one above the other.
2. Pull strap tight.
3. Turn windlass rod or knob to tighten to control bleeding.
4. Monitor the site, distal pulses should be absent if properly tightened.

**KEY POINTS**

- Apply directly to the skin 2-3 inches above wound.
- A distal pulse check should be accomplished. If a distal pulse is still present, consider additional tightening of the tourniquet or the use of a second tourniquet side by side and proximal to the first, to eliminate the distal pulse.
- Apply two tourniquets to lower extremity wounds. Tighten both.
- Expose and clearly mark all tourniquet sites with the time of tourniquet application.
- Use tourniquets to control life-threatening external hemorrhage that is possible to apply a tourniquet to for any traumatic amputation.
- Apply tourniquet to bare skin during normal use.
- Apply over clothing in tactical / hot / warm zone.
**IT CLAMP**

**INDICATIONS**

- The ITClamp50 device is indicated for use as an acute skin closure device for short-term soft tissue approximation to inhibit severe bleeding in trauma wounds, lacerations, junctional bleeds, or surgical incisions.

**PROCEDURE**

1. Open the package by pulling forward on the outer tabs.
2. Remove the device from the package by lifting, taking care not to close the device until it has been applied to the wound.
3. If the device has inadvertently closed, push the side buttons inward with one hand, and pull the device open with the other hand.
4. Locate the wound edges (fig 1).
5. Align the device parallel to the length of wound edge. Position the needles about 1-2 cm (0.5-1 in.) from the wound edge on either side (fig 2).
6. Press the arms of device together to close the device. Device seal will break with pressure (fig 3).
7. Ensure the entire wound is sealed and bleeding stops (fig 4).
8. A gauze or compression wrap can be placed around the device on the wound to protect the device and increase pressure on the wound to limit hematoma expansion.

**NOTE:** More than one device may be required.

---

**REMOVAL**

(Two-handed operation):
1. Holding the device by the arms, press the device closed (fig 5).
2. While maintaining pressure on the arms, press the release buttons with your other hand (fig 6).
3. While pressing the release buttons; pull the arms to open the device and rotate the needles out of the wound (fig 7 and 8).
HEMOSTATIC GAUZE

INDICATIONS

- Hemostatic gauze is indicated for supplemental bleeding control in addition to direct pressure where other methods of hemorrhage control are unable to be utilized due to location and direct pressure with standard gauze product has or is likely to fail.

PROCEDURE

1. Open hemostatic gauze package
2. Pack wound with contents
3. Apply pressure for at least 3 minutes
4. Apply standard bandaging over hemostatic gauze to maintain pressure
5. Take hemostatic gauze package with instructions for removal to ER
Direct pressure / Gauze

Placing pressure on the wound will constrict the blood vessels manually, helping to stem any blood flow. When applying pressure, the type and direction of the wound may have an effect, for instance, a cut lengthways on the hand would be opened by closing the hand into a fist, whilst a cut across the hand would be sealed by making a fist. A patient can apply pressure directly to their own wound, if their consciousness level allows. Direct pressure can be used with some foreign objects protruding from a wound; padding is applied from each side of the object to push in and seal the wound - objects are never removed. Use available gauze products to cover wounds and roll gauze products and / or tape to provide continued pressure to wounds.

Pressure points

The arterial pressure points

In situations where direct pressure and elevation are either not possible or proving ineffective the use of pressure points to constrict the major artery which feeds the point of the bleed is indicated. This is usually performed at a place where a pulse can be found, such as in the femoral artery. There is particularly high danger if constricting the carotid artery in the neck, as the brain is sensitive to hypoxia and brain damage can result within minutes of application of pressure. Pressure on the carotid artery can also cause vagal tone induced bradycardia, which can eventually stop the heart. Other dangers in use of a constricting method include rhabdomyolysis, which is a buildup of toxins below the pressure point, which if released back into the main bloodstream may cause renal failure.

Wound Packing

Step 1: Stop the bleeding. Now! Immediately apply direct pressure to the wound, using gauze, clean cloth, elbow, knee-whatever it takes to slow or stop the hemorrhage-until you have time to get out your wound packing supplies.

Step 2: Pack the wound with gauze. Tightly! Your goal is to completely and tightly pack the wound cavity to stop hemorrhage. Begin packing the gauze into the wound with your finger, while simultaneously maintaining pressure on the wound.

When no more gauze can be packed inside the wound, hold direct pressure on the wound for 3 minutes

It is critical that the gauze be packed as deeply into the wound as possible to put the gauze into direct contact with the bleeding vessel.

Step 3: Keep packing! The key to successful wound packing is that the wound be very tightly packed, applying as much pressure as possible to the bleeding vessel. This pressure against the vessel is the most important component of hemorrhage control. This explains why plain gauze (without an impregnated hemostatic agent), when tightly packed, is also quite effective.

Step 4: Apply very firm pressure to the packed wound for 3 minutes. This step pushes the packing firmly against the bleeding vessel and aids in clotting.

Step 5: Secure a snug pressure dressing and transport. After applying pressure for 3 minutes, place a snug pressure dressing over the wound. You may consider splinting or immobilizing the area, if possible because movement during transport can dislodge the packing and allow hemorrhage to restart.
INDICATIONS

- Suspected adult pelvic fractures and dislocations.

PROCEDURE

1. Unfold Pelvic Sling with white surface facing up.
2. Place white side of Pelvic Sling beneath patient at level of buttocks.
3. Firmly close Pelvic Sling by placing black Velcro side of flap down on the black Velcro strip (fold material and center at midline).
4. Grab orange handle on outer surface of flap and release from flap by pulling upward.
5. Firmly pull both orange handles in opposite directions to tighten the Pelvic Sling.
6. As soon as the buckle clicks, maintain tension and firmly press orange handle onto the black Velcro strip.

TO REMOVE PELVIC SLING

1. Lift orange free handle away from flap by pulling upward. Maintain tension and slowly allow Pelvic Sling to loosen.

KEY POINTS

1. Of 120,000 pelvic fractures reported in the U.S. in a typical year, 21,000 were pelvic ring fractures.
2. The mortality rate of pelvic fractures is reported to be more than 25%.
3. The combination of pelvic ring fractures with other injuries increases the mortality rate.
4. Stabilizing pelvic fractures reduces blood loss.
5. Victims are often confused or unconscious making it difficult to diagnose pelvic fractures without X-rays or CT scans. Physical examination is inaccurate approximately 90% of the time.
6. Trauma surgeons and emergency department physicians have recognized the benefits of circumferential pelvic compression.
7. At the time of initial evaluation, the exact type of fracture is usually unknown. In some cases, too little force will not close or stabilize the fracture, in others, too much force can collapse the pelvic ring.
8. Because of the potentially devastating hemorrhage associated with pelvic fractures, standard first aid protocol has included applying some type of circumferential binder around the victim’s hips.
9. Cannot be over-tightened. The force applied is safe and correct.
10. Standard size fits 95% of the population without cutting or trimming.

NOT RECOMMENDED FOR USE ON CHILDREN
PHARMACOLOGY

PROCEDURE
1. Instruct patients to administer nitrous oxide to themselves by placing the mask tightly against their face and breathing deeply and slowly
2. Allow mask to fall away from face spontaneously when effects are felt
3. Check blood pressure, as nitrous oxide may cause BP to drop in some cases

KEY POINTS
- Nitrous oxide is a self-administered analgesic gas containing a mixture of 50% oxygen and 50% nitrous oxide.
- Nitrous oxide is supplied in a carrying case containing two cylinders, one of nitrous oxide and one containing oxygen, with a mixing valve and supply tubing. These agents are mixed on administration to deliver a 50% concentration of each to the patient.
- Nitrous oxide should be given to any patient who is alert and complaining of severe pain.
- Only self-administration by the patient is to be used.
- Upon administration of nitrous oxide, constantly monitor patient to see he does not fall asleep with mask in place.
- The side effects of nitrous oxide, in addition to analgesia, include light-headedness, drowsiness, and very occasionally nausea and vomiting. Changes in heart rate and respiratory rate are minimal.
- Nitrous oxide and oxygen are both non-flammable gases, but both support combustion. For this reason, do not use nitrous oxide in areas where there is a combustion hazard.

There is an increased risk of liver cancer and birth defects to individuals who are exposed repeated applications of nitrous oxide. For this reason, nitrous oxide should be used in a well-ventilated environment.
SPECIAL PROCEDURES

TASERED PATIENT

ALL PATIENTS SUBJECT TO TASER USE MUST BE TRANSPORTED TO THE HOSPITAL FOR MEDICAL EVALUATION.

INDICATIONS

- Any patient that was subjected to taser use.

PROCEDURE

1. Follow Universal Patient Care Protocol.
2. Confer with law enforcement officer regarding the patient’s behavior prior to EMS arrival.
3. Refer to the appropriate medical protocol if the patient has a life-threatening injury or medical illness or continues to be combative.
4. Determine the location of the Taser probes. Do not remove probes unless they interfere with patient care.
5. Perform a 12-Lead EKG and continuously monitor the patient’s EKG. If the patient has a dysrhythmia, refer to the appropriate protocol.

KEY POINTS

- With the increased use and deployment of TASERS by our area’s local law enforcement agencies, EMS providers must be aware of the appropriate medical assessment of the tasered patient. The TASER is designed to transmit electrical impulses that temporarily disrupt the body’s central nervous system. Its Electro-Muscular Disruption (EMD) Technology causes an uncontrollable contraction of the muscle tissue, allowing the TASER to physically debilitate a target regardless of pain tolerance or mental focus.
- All patients subjected to taser use must be assessed for trauma and medical causes for the combative behavior.
- Always apply the cardiac monitor and obtain a strip for patients with irregular / abnormal pulse, elderly, pacer, AICD, known CAD, and excited delirium.
- The patient’s vital signs must be reassessed every 5 minutes.
- Determine if the patient used any mind altering drugs, has a cardiac history, and the date of their last tetanus shot.
- The cord or wire may be cut, but leave the probes embedded in the patient.
- Removal of the probe. (Remove one at a time).
- Stabilize the skin surrounding the puncture site by placing one hand by where the probe is embedded.
- Pull the probe straight out from the puncture site in one fluid motion.
- TASER barbs that do penetrate the skin and are removed in the field are to be treated as “contaminated sharps” and are to be placed in an appropriate sharps container. Use small single use containers as law enforcement may wish to hold custody of the barbs after removal.
SPECIAL OPERATIONS

ACTIVE SHOOTER / DIRECT THREAT PROTOCOL

Scene **CLEARED**, but NOT Secured
(WARM / HOT ZONE OPERATION)
Survivable injury and no life-threatening risk to rescuer

YES

LIFE THREATENING BLEEDING
- Pressure dressing
- Tourniquet
- Hemostatic gauze

TENSION PNEUMOTHORAX
- Chest Seal Device
- Needle decompression

AIRWAY
- Airway Positioning
- Oral airway
- Nasal Airway
- Consider advanced airway depending on resources and safety

EXTRICATE FROM HOSTILE ENVIRONMENT

RESUME CARE PER ESTABLISHED PROTOCOLS

**KEY POINTS**
- To be used in direct threat when scene has been cleared but not secured (Warm Zone).
- Priority is to intervene on immediate life-threatening conditions.
- Direct Threat Care is the care rendered by the medical provider while the provider and the patient are still within an effective hostile environment. These protocols are intended to be a guideline to medical intervention and cannot replace sound judgment and situational awareness. Providers are also cautioned not to rely on these protocols as a sole source of information about patient care, but rather to tailor their therapy to the clinical situation.
- Expedite removal to indirect threat environment.
- There is no need to immobilize the cervical spine with only penetrating trauma to the extremities or trunk. Consider cervical immobilization for penetrating neck trauma.
- Once scene secured, return to standard protocols.
- Warm / Hot Zone terminology should be considered the same as Inner Ring terminology for the purpose of this protocol.
SPECIAL OPERATIONS

PATIENT DECONTAMINATION

<table>
<thead>
<tr>
<th>INDICATIONS</th>
<th>SIGNS AND SYMPTOMS</th>
<th>PRECAUTIONS</th>
</tr>
</thead>
</table>
| • Any patient who may have been exposed to significant hazardous materials, including chemical, biological, or radiological weapons. | • Ambulatory / Non-Ambulatory
• Exposure to toxic substances (dry, liquids, fumes)
• Irritants
• Emergent / Non-Emergent | • Dry chemicals must be wiped off prior to wet decontamination
• Clothing must be removed
• Maintain patient privacy as needed.
• Gross Decon (Primary)
• Fine Decon (Secondary) |

PROCEDURE
1. In coordination with Hazardous Materials and other Emergency Management personnel, establish hot, warm, and cold zones of operation.
2. Ensure that personnel assigned to operate within each zone have proper personal protective equipment.
3. In coordination with other public safety personnel, assure each patient from the hot zone undergoes appropriate initial decontamination. This is specific to each incident; such decontamination may include:
   • Removal of patients from Hot Zone
   • Simple removal of clothing
   • Irrigation of eyes
   • Passage through high-volume water bath (e.g., between two fire apparatus) for patients contaminated with liquids or certain solids. Patients exposed to gases, vapors, and powders often will not require this step as it may unnecessarily delay treatment and/or increase dermal absorption of the agent(s).
4. Initial triage of patients should occur after step #3. Immediate life threats should be addressed prior to technical decontamination.
4. Assist patients with technical decontamination (unless contraindicated based on #3 above). This may include removal of all clothing and gentle cleansing with soap and water. All body areas should be thoroughly cleansed, although overly harsh scrubbing which could break the skin should be avoided.
5. Place triage identification on each patient. Match triage information with each patient’s personal belongings, which were removed during technical decontamination. Preserve these personnel affects for law enforcement.
6. Monitor all patients for environmental illness.
8. Transport patients per local protocol.

Notify Hospital EARLY of contaminated patients; assure time for mobilization of Hospital Emergency Response Team (H.E.R.T) or other resources.

q 5 minutes until symptoms resolved

TRANSPORT to appropriate facility
CONTACT receiving facility
CONTACT Medical Direction where indicated

EMT Intervention AEMT Intervention PARAMEDIC Intervention Online Medical Control
## NERVE AGENT EXPOSURE KIT

### INDICATIONS
- Nerve agent exposure (e.g., VX, Sarin, Soman, etc.)
- For use of Fire, EMS, and Police personnel only

### SIGNS AND SYMPTOMS
- Visual disturbances
- Headache
- Nausea / vomiting
- Salivation
- Lacrimation
- Respiratory distress
- Diaphoresis
- Seizure activity
- Respiratory arrest

### CONTRAINDICATIONS
- Vescicant exposure (e.g., Mustard Gas, etc.)
- Respiratory irritant exposure (e.g., hydrogen sulfide, ammonia, chlorine, etc.)

### KEY POINTS
- If Triage / MCI issues exhaust supply of Mark 1 kits or DuoDotes, use Atropine. Give 2 mg IM dose for patients greater than 90 pounds (>40kg).
- Follow local HAZMAT protocols for decontamination and use of personal protective equipment.
- For patients with major symptoms, there is no limit for atropine dosing.
- Carefully evaluate patients to ensure they not from exposure to another agent. (e.g., narcotics, vesicants, etc.)
- Each DuoDote auto injector contains both 600 mg of pralidoxime (2-PAM) and 2.1 mg of atropine
- Each valium auto injector contains 10 mg of valium
- If the presence of a nerve agent is suspected by presentation of symptoms of large numbers of patients, personnel should immediately contact dispatch to notify other responding units and command staff.
- The patient and / or crew must be decontaminated prior to transport. DO NOT transport a contaminated patient to a treatment facility.
- SLUDGEM: Salivation, Lacrimation, Urination, Gastrointestinal upset, Emesis, Muscle twitching.
- When the nerve agent has been ingested, exposure may continue for some time due to slow absorption from the lower bowel, and fatal relapses have been reported after initial improvement.
- If dermal exposure has occurred, decontamination is critical and should be done with standard decontamination procedures. Patient monitoring should be directed to the same signs and symptoms as with all nerve or organophosphate exposures.
- Continued medical monitoring and transport is mandatory.
Ohio Senate Bill 58 became Law in September 2010.

The Law includes provisions for EMS providers to withdraw blood for evidence collection in cases involving allegations of operating watercraft or vehicles under the influence.

The language of the bill states that drawing blood “may” not “shall” be done for evidence collection “in the course of” providing emergency medical treatment.

- You CANNOT be dispatched or called by the police for the sole purpose of performing phlebotomy when the person does not require emergency medical treatment.

- The Paramedic/AEMT in charge can refuse law enforcements request to draw the blood if doing so would interfere with lifesaving patient care or outcome.

- The patient must consent to the collection of blood for evidence purposes.
  (If unconscious, Implied Consent applies)

- The Police Officer making the request must always be present during the draw and must provide the Paramedic/AEMT with the evidence collection kit.

- EMS Providers MUST use the evidence kit provided by law enforcement to obtain the blood samples for evidence.

Regional Protocol Participation

These protocols have been designed and reviewed by the Northeast Ohio Regional EMS Protocol advisory board. This protocol is intended to attempt to standardize, as much as possible, EMS care for the participating agencies despite hospital affiliation or locality.

The individual Medical Director for each participating agency reserves the right to allow whatever level of participation in this protocol they choose. Supply of medications and equipment is also at the discretion of the medical director and the EMS agency. EMS providers that have protocol for a situation, but do not have a therapy or intervention noted within at the election of the Medical Director, are not in violation of the protocol.
EMS LEVELS OF CERTIFICATION

These protocols recognize that there is a role for all levels of Emergency Medical Technician Certification. Not every function defined by the State of Ohio is approved under specific hospital Medical Directors. Patient care should always be delivered at the highest level of EMS available. All Provider levels must function within the State of Ohio EMS Scope of Practice for their Provider level. Every EMS Provider must be aware of the State of Ohio requirements for recertification, and each individual is responsible for personally fulfilling these requirements. Those seeking to fulfill National Registry of Emergency Medical Technician (NREMT) requirements may do so under their own individual responsibility.

Continuing Education certifications must be received through an approved Continuing Education site with a valid accreditation number noted and must be filed properly. Each EMS Provider must maintain his / her own personal records and be responsible for his / her own Continuing Education status.

EMS Provider problems will be addressed promptly and documented by the Medical Director in conjunction with the EMS Coordinator, Fire / EMS Chief. A plan to resolve identified problems will be implemented. The Medical Director has the right to remove an EMS Provider from actively functioning under their Medical Control, either temporarily or permanently.
MEDICAL CONTROL / OVERVIEW

EMS RECERTIFICATION REQUIREMENTS

Please refer to the Ohio EMS website for current continuing education requirements

https://www.ems.ohio.gov/links/ems_CERequirementsEMS.pdf

For providers wishing to keep up their National Registry certification please refer to the National Registry website

https://nremt.org/document/recertification
MEDICAL CONTROL / OVERVIEW

EMS COMMUNICATIONS

Direct communication by EMS with the receiving hospital is required to insure continuity of care and the accurate reporting of the incoming patient’s condition, history, and treatment. A member of the prehospital care team must contact the receiving hospital at the earliest time that is conducive to good patient care.

If patient treatment advice is needed or if Medical Command orders are required per the protocol, Medical Command should be contacted. Medical Command will provide advice and any protocol orders deemed necessary in the care of the patient. If transporting the patient to another facility, EMS will then contact the receiving hospital as stated above.

PURPOSE

- To provide the receiving hospital and accurate, updated report of the patient’s presentation and condition throughout prehospital care and transport.
- To allow the receiving hospital the opportunity to prepare for receiving the patient and continue necessary medical treatment.

PROCEDURE

1. Contact the receiving facility and provide the following information:
   - Type of Squad: EMT, Advanced EMT, Paramedic
   - Age and Sex of Patient
   - Type of Situation: Injury and/or Illness
   - Specific Complaint: Short and to the point (i.e., chest pain, skull fracture)
   - Mechanism: MVA / MCA / Fall
   - Vital Signs: B/P / Pulse / Resp. / LOC / EKG
   - Patient Care: Airway Management, Circulatory Support, Drug Therapy
   - General Impression: Stable / Unstable
   - Destination ETA

KEY POINTS

- When calling in a report it should begin by identification of the squad calling, and the level of care that can be provided to the patient (EMT, AEMT, Paramedic) and the nature of the call (who you need to talk with, physician or nurse).
- Whenever possible, the EMS provider responsible for the highest level of direct patient care should call in the report.
- Although all EMS Providers have been trained to give a full, complete report, this is often not necessary and may interfere with the physician’s duties in the Emergency Department. Reports should be as complete but concise as possible to allow the physician to understand the patient’s condition.
- It is not an insult for the physician to ask questions after the report is given. This is often more efficient than giving a thorough report consisting mostly of irrelevant information.
- If multiple victims are present on the scene, it is advisable to contact Medical Control with a preliminary report. This should be an overview of the scene, including the number of victims; seriousness of the injuries, estimated on-scene and transport times to the control hospital or possible other nearby facilities. This allows preparation for receiving the victims and facilitates good patient care.
MEDICAL CONTROL / OVERVIEW

EMS DOCUMENTATION

- An EMS patient care report form (PCR) will be completed accurately and legibly to reflect the patient assessment, patient care and interactions between EMS and the patient, for each patient contact which results some assessment component.
- Every patient encounter by EMS will be documented. Vital signs are a key component in the evaluation of any patient and a complete set of vital signs is to be documented for any patient who receives any assessment component.

PURPOSE
To document total patient care provided including:
- Care provided prior to EMS arrival.
- Exam of the patient as required by each specific complaint-based protocol.
- Past medical history, medications, allergies, living will / DNR, and personal MD.
- All times related to the event.
- All procedures / medications administered and their associated time and patient response.
- Notation of treatment authorization if any deviation from protocol / narcotic use.
- Reason for inability to complete or document any above item.
- A complete set of vital signs.

PROCEDURE
1. The patient care report should be completed as soon as possible after the time of the patient encounter.
2. All patient interactions are to be recorded on the patient care report form or the disposition form (if refusing care).
3. The patient care report form must be completed with the above information.
4. A copy of the patient care report form should be provided to the receiving medical facility.
5. A copy of the patient care report form is to be maintained by the EMS entity.
6. A copy of the patient care report shall be given to the Medical Director per his or her order.

KEY POINTS
- Document the contact and any on-line medical direction that is given. If you are not able to reach Medical Control, document attempts and cause for failure. Always describe the circumstances of the call. It is very important to document the mental status of the patient who refuses transport. Any refusal call should also note the contact of Medical Control.
- The times vitals are taken must be noted. Vitals should be repeated every five minutes or following any medical treatments. Vitals should be completely recorded. If a part of the set of vitals is omitted, the reason should be clearly given.
- Use accepted medical abbreviations and terminology. Do not make them up.
- Try to spell correctly. Become familiar with the correct spelling of commonly used words.
- The name, dose, route, time and effect should be documented for all medications.
- When standards are followed such as in a full arrest; every step should be documented. To write "ACLS protocols followed" is NOT SATISFACTORY.
- When providing copies of the run report for the Emergency Department and the Medical Director, be sure to include the EKG strips and second sheets.
- A complete set of times must be recorded on every report.

Documentation of Vital Signs:
1. An initial complete set of vital signs includes:
   - Pulse rate
   - Systolic AND diastolic blood pressure
   - Respiratory rate
   - Pain / severity (when appropriate to patient complaint)
   - Pulse Oximetry
2. Every attempt should be made to auscultate blood pressures, however if unable to auscultate, a palpated pressure will suffice.
3. If the patient refuses this evaluation, the patient’s mental status and the reason for refusal of evaluation must be documented, along with an offer to return and transport. Medical Control contact should be noted.
4. Document situations that preclude the evaluation of a complete set of vital signs.
5. Record the time vital signs were obtained.
6. Any abnormal vital sign should be repeated and monitored closely.
7. All completed run reports should contain a summary statement regarding patient status upon transfer or care and to whom.
MEDICAL CONTROL / OVERVIEW

EMERGENCY DEPARTMENT RESTRICTIONS

This procedure provides for hospitals to notify the EMS departments of restrictions in their patient care capabilities. EMS departments should honor hospital restrictions unless doing so would endanger the patient.

RESTRICTION EXCEPTIONS

Regardless of what status a hospital has imposed on its facility, there are situations when EMS personnel should be able to transport a patient to the facility. These exceptions apply only to general hospitals having a full-service Emergency Department, and do not apply to specialty facilities. The type of cases that should always be accepted are as follows:

1. Patients in cardiac arrest due to either medical or traumatic causes.
2. Patients whose airways cannot be controlled by the EMS Personnel.
3. Patients felt to be in extremis to the point that diversion to another facility would dangerously delay needed immediate stabilization. This is based on the judgment of the EMS provider in charge.
4. Patients who typically receive their care at the hospital on diversion, and any diversion from that hospital would potentially jeopardize the expedient care of their emergency condition.
5. Unstable Pediatric patients
6. Unstable Obstetric patients
7. If the EMS provider in charge states that they are not comfortable diverting and states that transport must be made to the facility (due to family or physician situation / request).
MEDICAL CONTROL / PROCEDURES

ADVANCED DIRECTIVES - DO NOT RESUSCITATE (DNR) ORDERS

PURPOSE

- Ideally, any patient presenting to the EMS system with a valid DNR form shall have the form honored and CPR and ALS therapy withheld in the event of cardiac arrest.
- To honor the end of life wishes of the patient
- To prevent the initiation of unwanted resuscitation

PROCEDURE

Ohio’s DNR Comfort Care is the only law encompassing EMS. For any other type of DNR documents, you must contact Medical Control and describe your circumstances to a Physician. The Physician will then decide if EMS should honor the DNR document or begin resuscitation of the patient. This includes the Ohio Living Will or any other document to this effect.

A DNR order for a patient of a healthcare facility shall be considered current in accordance with the facility’s policy. A DNR order for a patient outside a healthcare facility shall be considered current unless discontinued by the patient’s attending physician / CNP / CNS or revoked by the patient. EMS personnel are not required to research whether a DNR order that appears to be current has been discontinued.

STATE OF OHIO DNR COMFORT CARE GUIDELINES

Under its DNR Comfort Care Protocol, the Ohio Department of Health has established two standardized DNR order forms.

**DNR Comfort Care – Terminally ill condition and in effect always.**

**DNR Comfort Care – Arrest – In effect in the event of a cardiac or respiratory arrest.**

When completed by a doctor (or certified nurse practitioner or clinical nurse specialist, as appropriate), these standardized DNR orders allow patients to choose the extent of the treatment they wish to receive at the end of life. Ohio DNR Comfort Care can be identified by the original / copy of the State of Ohio DNR Comfort Care Form with official DNR logo, a DNR Comfort Care necklace, bracelet, or card with official DNR Comfort Care logo, the form must be completed with effective date and signed by the patient’s physician. To enact the DNR Comfort Care, the patient must be experiencing a terminal event. EMS is not required to search for a DNR identification but should make a reasonable attempt to identify that the patient is the person named in the DNR Comfort Care form. **Only the patient may request reversal of the DNR – Comfort Care.**

**CARE to be provided by EMS:**

- Suction the airway
- Administer oxygen (Including CPAP and BiPap)
- Position for comfort
- Splint of immobilize
- Control bleeding
- Provide pain medication
- Provide emotional support
- Contact other appropriate health care providers (hospice, home health, attending physician or certified nurse)

**Care NOT to be provided by EMS:**

- Administer chest compressions
- Insert artificial airway
- Administer resuscitative drugs
- Defibrillate or cardiovert
- Provide respiratory assistance (other than described above)
- Initiate resuscitative IV
- Initiate cardiac monitoring
KEY POINTS

- The DNR order addresses your current state of health and the kind of medical treatment you and your physician decide is appropriate under current circumstances.
- A DNR order for a patient of a health care facility shall be considered current in accordance with the facility’s policy. A DNR order for a patient outside a health care facility shall be considered current unless discontinued by the patient’s attending physician / CNP / CNS or revoked by the patient. EMS personnel are not required to research whether a DNR order that appears to be current has been discontinued.
- It is imperative that a copy of or the original DNR / Comfort Care orders and identification accompany the patient wherever the patient goes. This will help to alleviate any confusion between health care givers at multiple sites.
- Be careful to check the patient’s DNR order or DNR identification to determine if DNR - CC or DNR - CC Arrest.
- EMS is not required to search a person to see if they have DNR identification. If any of the DNR identifiers are in the possession of the patient, EMS must make a reasonable attempt to identify the patient by patient’s name given by patient, family, caregiver or friend, health care worker who knows the patient, ID band from health care institution, driver’s license or another picture I.D. If identification cannot be verified, the protocol should be followed.
- The patient may request resuscitation even if he / she is a DNR Comfort Care or DNR Comfort Care-Arrest Patient and / or the DNR Comfort Care Protocol has already been activated. The patient’s request for resuscitation amounts to a revocation of any or all DNR Comfort Care Status and resuscitative efforts must be activated.
- If EMS has responded to an emergency by initiating any of the “will not perform actions” prior to confirming that the DNR Comfort Care Protocol must be activated, discontinue them when you activate the protocol. You may continue respiratory assistance, IV medications, etc., that have been part of the patient’s ongoing course of treatment for their underlying condition or disease.
- If the patient’s family or bystanders request or demand resuscitation for a patient for whom the DNR Comfort Care Protocol has been activated, do not proceed with resuscitation. Provide “will perform actions” as outlined above and try to help them understand the dying process the patient’s initial choice not to be resuscitated.
- For EMS - The Ohio DNR Comfort Care law is the only one you (EMS) can honor on your own. For any other types of DNR documents, you must contact Medical Control and describe your circumstances to a Physician. The Physician will decide if you should honor the DNR document or begin resuscitation of the patient.
- Your living will document specifies in advance the kind of medical treatment you would want when you have a terminal illness or are in a permanently unconscious state and are no longer able to state your own wishes. It may not protect you from receiving CPR or other heroics. It only takes effect if you are in a certifiably terminal or permanently unconscious state, and emergency squad personnel cannot determine if you meet these conditions.
- A Health Care Power of Attorney is a document that names another person (usually a spouse, child, or other relative, and preferably someone who can understand your health status and make hard decisions on your behalf, if necessary) to make health care decisions for you whenever you are unable to do so yourself. It is not a DNR order, though it ordinarily would permit the person you appoint to agree to a DNR order for you, if you are unable to express your wishes at the time.
- The General Power of Attorney usually does not address health care issues and ends if you become disabled. You may have given your general power of attorney to someone to manage your financial affairs while you were on vacation or in the hospital. If you want a general power of attorney to continue, even if you become disabled, the document must state that it is a durable, or continuing, power of attorney. A health care power of attorney is a durable power; it continues even after you become disabled and appoints someone to carry out your health care wishes.
Helicopter / Hospital Intercepts
If the patient requires specialized care, i.e. trauma center, and conditions allow for rapid transport to the nearest facility, a helicopter/hospital intercept can be initiated. When a helicopter / hospital intercept is initiated, the receiving hospital will be contacted, advised of request for helicopter intercept and minimum patient information of nature of call / chief complaint, and then the receiving hospital will direct the appropriate personnel to call for the helicopter.

Scene Flights
Scene flights will be organized with the cooperation of the responding EMS, fire, and law enforcement agencies. The following defines how the on-scene Incident Command (IC) should request an Air Ambulance to the scene of an emergency incident due to the mixture of public fire, EMS and private EMS systems.

- Recognize that it is safer to transport a patient from a well - lit, specially designed helipad than it is from an accident scene. EMS must be aware of the potential danger presented by poor lighting and potential scene hazards such as electrical wires or fire. Limit helicopter scene loading to the few cases where it is essential.
- Patient transportation via ground ambulance will not be delayed waiting for helicopter transportation. If the patient is packaged and ready for transport and the helicopter is not on the ground, or within a reasonable distance, the transportation will be initiated by ground ambulance.
- Time estimation should be made from the time the patient is ready for transport to arrival at the medical facility / the most appropriate trauma center. This should include aircraft response to the scene.
- The helicopter crew shall use their best judgment, at the suggestion of On - Line Medical Direction, and / or prior guidelines agreed to with Off - Line Medical Direction to determine the destination hospital.
- EMS should request aeromedical transport of the patient to the closest most appropriate hospital, based upon location, patient or family request, and the capabilities of the hospitals (i.e.: Trauma Center, OB Unit, etc.).

A request for aeromedical service response may be initiated when one or more of the following conditions exists:

- The patient’s airway, breathing, or hemorrhage / circulation cannot be controlled by conventional means and the estimated arrival time of the air medical service is less than the time re- quired for ground transport to the nearest hospital.
- High priority patient with > 20-minute transport time.
- Entrapped patients > 10-minute estimated extrication time.
- Access hard to reach victims for whom the helicopter will have a special advantage.
- When enough other Mutual Aid resources are not available.
- Transport assistance in dispersing multiple, serious victims to more distant hospitals. It is recognized that in major emergency incidents, the local Emergency Management Plan permits no direct communications by squads with On-Line Medical Direction.
- To bring a physician and equipment resources to a patient who specifically needs these on the scene. (Physician not available on all helicopter services).
- Multiple casualty incident with red / yellow tag patients.
- Multi-trauma or medical patient requiring life-saving treatment not available in prehospital environment (i.e., blood transfusion, invasive procedure, operative intervention).

If a potential need for air transport is anticipated, but not yet confirmed, an air medical transport service can be placed on standby.

If the scene conditions or patient situation improves after activation of the air medical transport service and air transport is determined not to be necessary, paramedic or administrative personnel may cancel the request of air transport.
The minimum information which should be provided to the air medical transport service include:

a. Number of patients  
b. Age of patients  
c. Sex of patients  
d. Mechanism of injury or complaint (MVC, fall, etc.)

**AEROMEDICAL LANDING ZONE (LZ) SET UP PROCEDURE**

1. LZ area should be free of obstructions. Eliminate these hazards:
   - Wires (surrounding the landing area and High-Tension power lines within 1/2 mile)
   - Towers (TV, Radio, Cellular within 1/2 mile)
   - Trees
   - Signs and Poles
   - Buildings
   - Vehicles
   - People

2. LZ area should be 100' X 100' if possible.

3. LZ should have as little of a slope as possible (less than 5 degrees).

4. LZ corners should be marked with highly visible devices (cones, flairs, strobes).

5. No debris on landing surface and within 100' of landing area.

6. Land the helicopter(s) a safe distance from the scene / patient.

7. Never point bright lights directly at the aircraft!

8. Maintain security of LZ while helicopter is present.

9. Landing Zone Briefing.

10. Type of LZ surface and size

11. How LZ is marked (cones, flairs, strobes, etc.).

12. All noted obstructions (see list above).

---

**NEVER ASSUME A FLIGHT CREW WILL SEE A HAZARD**  
**NEVER APPROACH A HELICOPTER UNLESS DIRECTED BY FLIGHT CREW**
• **Under the auspices of each individual EMS jurisdiction and the Medical director**, this protocol provides an alternative transportation option for use by EMS personnel for patients that do not require emergent ambulance transportation.

**PURPOSE**
• To provide a suggested alternative transportation option to non-emergent patients who do not require emergent ambulance transportation.

**PROCEDURE**
Before advocating other means of transportation, EMS personnel must perform ALL the following:
1. Appropriate medical exam, including vital signs.
2. Obtain pertinent patient information.
3. Contact Medical Control

**ALTERNATIVE TRANSPORT GUIDELINES**
Patient complaints for which EMS personnel may recommend other means of transportation to medical care are limited to the following:
• Ear pain with no apparent object in ear
• Minor extremity lacerations with no gross loss of function
• Pain or burning on urination
• Penile discharge
• Minor vaginal discharge unless the patient is obviously pregnant or suspects she is pregnant
• Toothache without swelling or radiating jaw pain. Pt must be transported if evident of impending airway compromise
• Minor sore throats and colds
• Prescription refills
• Scheduled clinic appointments

**KEY POINTS**
EMS personnel MAY NOT decline transport, or in any way suggest alternative means of transportation for any of the following patients, complaints, or situations:
1. Less than 18 years of age
2. Suicide Attempt
3. Intoxication
4. Abuse or negligence of adult or child
5. Any situation where the crew’s best judgement indicates transport

• Whenever presented with a medical complaint other than those listed in the Alternative Transport Guidelines section follow the appropriate treatment protocol for patient care as authorized in these protocols or contact Medical Control

**DO NOT DEViate FROM THE GUIDELINES SET FORTH IN THE ALTERNATIVE TRANSPORT POLICY**
PURPOSE:
To provide personal protection recommendations to EMS providers who are presented with a patient in a known or suspected bed bug infestation.

PROCEDURE:
- Take universal precautions.
- Take only needed equipment into the area of infestation to minimize exposure.
- Seal equipment in plastic bags when necessary to prevent exposure.
- Avoid sitting on beds or furniture. If you must sit, do so on a hard surface.
- If you feel you have been infested, shower and seal clothes in a plastic bag.
- Place potentially exposed clothing in a hot dryer for 10 minutes to kill the bugs.
- Footies, caps, and gloves should be worn if available during care.
- Remove these items before entering the vehicle and place in a plastic bag.
- Dispose of trash bags containing used PPE equipment in sealed containers.
- Keep patients wrapped during transport as much as possible to prevent transfer of bed bugs to the ambulance, or locations other than the hospital room the patient is put into.
- Clean and disinfect the vehicle as soon as possible.
- Notify the receiving facility as soon as possible regarding potential for bed bug exposure.
GENERAL CONSIDERATIONS

1. Treat the ABC’s first. Treat the child, not the equipment. If the emergency is due to an equipment malfunction, manage the child appropriately using your own equipment.

2. Children formerly cared for in hospitals or chronic care facilities are often cared for in homes by parents or other caretakers. These children may have self-limiting or chronic diseases. There are multitudes of underlying medical conditions that may categorize children as having special needs. Many are often unstable and may frequently involve the EMS system for evaluation, stabilization, and transport. Special needs children include technology-assisted children such as those with tracheostomy tubes with or without assisted ventilation, children with gastrostomy tubes, and children with indwelling central lines. The most serious complications are related to tracheostomy problems.

3. Children with Special Healthcare Needs (CSHCN) have many allergies. Children with spina bifida are often allergic to latex. Before treating a patient, ask the caregivers if the children are allergic to latex or have any other allergies. Stock latex-free equipment. (Some regularly used equipment that contains latex includes gloves, oxygen masks, IV tubing, BVM, blood pressure cuff, IV catheters, etc.)

4. Knowing which children in a given area have special needs and keeping a logbook is encouraged.

5. Parents and caretakers are usually trained in emergency management and can be of assistance to EMS personnel. Listen carefully to the caregiver and follow his/her guidance regarding the child’s treatment.

6. Children with chronic illnesses often have different physical development from well children. Therefore, their baseline vital signs may differ from normal standards. The size and developmental level may be different from age-based norms and weight/length-based resources used to calculate drug dosages. Ask the caregiver if the child normally has abnormal vital signs. (i.e. a fast heart rate or a low pulse oximeter reading)

7. Some CSHCN may have sensory deficits (i.e. they may be hearing impaired or blind) yet may have age-appropriate cognitive abilities. Follow the caregivers’ lead in talking to and comforting a child during treatment and transport. Do not assume that a CSHCN is developmentally delayed.

8. When moving a special needs child, a slow careful transfer with two or more people is preferable. Do not try to straighten or unnecessarily manipulate contracted extremities as it may cause injury or pain to the child. Certain medical conditions will require special care. Again, consult the child’s caregiver.

9. Caregivers of CSHCN often carry “go bags” or diaper bags that contain supplies to use with the child’s medical technologies and additional equipment such as extra tracheostomy tubes, adapters for feeding tubes, suction catheters, etc. Before leaving the scene, ask the caregivers if they have a “go bag” and carry it with you.

10. Caregivers may also carry a brief medical information form or card. The child may be enrolled in a medical alert program whereby emergency personnel can get quick access to the child’s medical history. Ask the caregivers if they have an emergency information form or some other form of medical information for their child.

11. Caregivers of CSHCN often prefer that their child be transported to the hospital where the child is regularly followed or the “home” hospital. When making the decision as to where to transport a CSHCN, take into account: local protocols, the child’s condition, capabilities of the local hospital, caregivers’ request, ability to transport to certain locations.
• Domestic violence is physical, sexual, or psychological abuse and/or intimidation, which attempts to control another person in a current or former family, dating, or household relationship. The recognition, appropriate reporting, and referral of abuse is a critical step to improving patient safety, providing quality health care, and preventing further abuse.

• Elder abuse is the physical and/or mental injury, sexual abuse, negligent treatment, or maltreatment of a senior citizen by another person. Abuse may be at the hand of a caregiver, spouse, neighbor, or adult child of the patient. The recognition of abuse and the proper reporting is a critical step to improve the health and well-being of senior citizens.

• Child abuse is the physical and mental injury, sexual abuse, negligent treatment, or maltreatment of a child under the age of 18 by a person who is responsible for the child’s welfare. The recognition of abuse and the proper reporting is a critical step to improving the safety of children and preventing child abuse.

PURPOSE
Assessment of an abuse case based upon the following principles:

• Protect the patient from harm, as well as protecting the EMS team from harm and liability.

• Suspect that the patient may be a victim of abuse, especially if the injury/illness is not consistent with the reported history.

• Respect the privacy of the patient and family.

• Collect as much information and evidence as possible and preserve physical evidence.

PROCEDURE
1. Assess the/all patient(s) for any psychological characteristics of abuse, including excessive passivity, compliant or fearful behavior, excessive aggression, violent tendencies, excessive crying, behavioral disorders, substance abuse, medical non-compliance, or repeated EMS requests. This is typically best done in private with the patient.

2. Assess the patient for any physical signs of abuse, especially any injuries that are inconsistent with the reported mechanism of injury. The back, chest, abdomen, genitals, arms, legs, face, and scalp are common sites for abusive injuries. Defensive injuries (e.g., to forearms), and injuries during pregnancy are also suggestive of abuse. Injuries in different stages of healing may indicate repeated episodes of violence.

3. Assess all patients for signs and symptoms of neglect, including inappropriate level of clothing for weather, inadequate hygiene, absence of attentive caregiver(s), or physical signs of malnutrition.

4. Assess all patients for signs of sexual abuse, including torn, stained, or bloody underclothing, unexplained injuries, pregnancy, or sexually transmitted diseases.

5. Immediately report any suspicious findings to the receiving hospital (if transported). If an elder or disabled adult is involved, also contact the Department of Social Services (DSS). After office hours, the adult social services worker on call can be contacted by the 911 communications center. EMS should not accuse or challenge the suspected abuser. This is a legal requirement to report, not an accusation. In the event of a child fatality, law enforcement must also be notified.

KEY POINTS

SEXUAL ASSAULT:

• A victim of a sexual assault has experienced an emotionally traumatic event. It is imperative to be compassionate and non-judgmental. Be sensitive to the victim. Expect a wide range of response to such an assault, depending upon social, cultural, and religious background.

• An abbreviated assessment may be indicated based on the patient’s mental state.

• Your responsibility is patient care and not detective work. Questioning of the patient should be limited, because there is no need for the EMS provider to attempt to get a detailed description of the assault. That type of questioning by EMS can harm the investigation and should be left up to professional investigators. However, carefully document verbatim anything the patient says about the attack. DO NOT paraphrase. Based upon the patient’s mental state, the following questions may be asked and documented: (Do not persist with questions.)

• What happened? (A brief description is acceptable)

• When did the attack occur?

• Did the patient bathe or clean up after the attack?

• If the patient changed his/her clothes, attempt to bring the clothes in a brown paper bag. DO NOT use a plastic bag.

• If the patient did not change his/her clothes, have the patient bring a change of clothes to the hospital (if possible).

• Transport the patient to an appropriate medical facility. Some hospitals can provide additional sexual assault care (SANE Program).
RED FLAGS TO CHILD ABUSE:
The presence of a red flag does not necessarily mean maltreatment. The suspicion of maltreatment is also based upon the EMS provider’s observations and assessment.

Signs that parents may display may include (not all inclusive):
- Parent apathy
- Parent over reaction
- A story that changes or that is different when told by two different “witnesses”
- Story does not match the injury
- Injuries not appropriate for child’s age
- Unexplained injuries

Signs that the child may display may include (not all inclusive):
- Pattern burns (donuts, stocking, glove, etc.)
- Child abuse / neglect are widespread enough that nearly all EMS providers will see these problems at some time. The first step in recognizing abuse or neglect is to accept that they exist and to learn the signs and symptoms.
- Initiate treatment as necessary for situation using established protocols.
- If possible remove child from scene, transporting to hospital even if there is no medical reason for transport.
- If parents refuse permission to transport, notify law enforcement for appropriate disposition. If patient is in immediate danger, let law enforcement handle scene.
- Advise parents to go to hospital. AVOID ACCUSATIONS as this may delay transport. Adult with child may not be the abuser.

**AREAS FOR CONCERN**

- ~ Doesn’t sleep well
- ~ Recent death in family
- ~ Appears nervous
- ~ Appears depressed / cries easily

**Substance abuse**
- ~ Alcohol
- ~ Other drugs
While the possibility of finding a dangerous weapon on a scene has always existed, EMS personnel must be aware of current issues, which impose unique hazards upon them while performing their duties. These dangers present in many different ways, regardless of jurisdiction or call volume. Though not all accidents can be prevented, awareness must be made regarding the State of Ohio Concealed - Carry Laws.

Ohio's Concealed - Carry Law permits individuals to obtain a license to carry a concealed handgun in Ohio, including into private businesses if the licensee also carries a valid license and valid identification when carrying the concealed handgun. This law has been in effect since April 8th, 2004. Be aware that all patients may be carrying a dangerous weapon at all times, regardless of whether a permit has or has not been issued.

GUIDELINES

- Upon arrival at the scene, EMS personnel should directly ask patients if they are carrying a weapon prior to performing a physical assessment. If the patient is unable to answer, please proceed with caution.
- If a weapon is present on scene or with a patient, it is recommended that a Law Enforcement official be present to secure the weapon.
- The training of EMS personnel in the safe handling and use of firearms lock boxes in squads is a departmental and municipal decision.
- Caution is advised due to the many types of weapons and the handler’s ability to modify them.
- When transporting a patient to the hospital, please inform the receiving facility that a weapon has been found on the patient. This will allow enough time for Security to safely secure the weapon and maintain possession of it until Law Enforcement arrives.
MEDICAL CONTROL / PROCEDURES
CONSENT AND REFUSAL OF CARE GUIDELINES

PURPOSE
To provide:
- Rapid emergency EMS transport when needed.
- Protection of patients, EMS personnel, and citizens from undue risk when possible.
- Method to document patient refusal of care.

PROCEDURES - ADULT Consent:

Two types apply.
Express Consent, where a conscious, oriented (to person, place, and time) competent adult (over 18-year-old) gives the EMS provider permission to care for him. This may be in the form of a nod, verbal consent or gesture after the intended treatment has been explained.
Implied Consent occurs when a person is incapable of giving their permission for treatment due to being unconscious or incompetent. It is assumed that their permission would be given for any lifesaving treatments.

Refusal of Treatment:

Capacity: An adult with mental capacity to make informed decisions, may refuse treatment even after calling for help. The person must be informed that they may suffer loss of life, limb, or severe disability if they refuse care and transport, and sign a Release indicating that they understand this. If the patient refuses to sign, a witness at the scene, preferably a relative should sign. Documentation of the events must be clearly made. It also must be documented on the run sheet that the person is oriented to person place and time, and a set of vital signs should be obtained if possible. An offer to return and transport them later should be made by EMS. Contact with Medical Control should be made if there is any question about the person’s capacity to make decision. If the need for treatment is obvious, speaking directly to the Nurse or Physician may assist in convincing the patient to be transported.

For the purposes of this protocol, capacity will be defined as – Lucid and capable of making an informed decision, alert to Person, Place, Time, and Event.

Without Capacity: While an adult may refuse treatment, in some situations, their refusal may not have basis if they do not have to capacity to make an informed decision. In the following situations, the refusal of treatment may be without capacity.

- Patients showing altered mental status due to head trauma, drugs, alcohol, psychiatric illness, hypotension, hypoxia, or severe metabolic disturbances.
- Violent patients.
- Uncooperative minors.

PROCEDURES – MINORS consent

Consent to treat Minors:

Consent to treat Minors (under the age of 18 years in Ohio), must be obtained from the parent or guardian with two exceptions; there is need for life saving immediate treatment which should be given to the point of it being considered elective; or the Minor is emancipated; i.e.: married, living on their own, or in the armed forces and may give permission themselves.
Refusal of Treatment:

A minor might refuse to cooperate with the EMS crew, or the minor’s parent or guardian may refuse to consent to necessary treatment of the minor. A minor under the age of 18 years may not refuse treatment in Ohio. Transport should be initiated unless the parent or legal guardian refuse treatment on behalf of the minor. A circumstance may occasionally arise where the patient is a minor and there is no illness or injury, yet EMS has been called to the scene. If the responsible person is not able to be at the scene, it is acceptable for contact to be made by telephone. If care and transport is refused by the parent or guardian, TWO witnesses should verify this, and this shall be documented and signed by both witnesses on the run sheet. A request may be made that the person come to the fire station as soon as possible, to sign the release. A second circumstance may occur when the minor patient really needs to be transported and the parent or guardian is refusing transport. In this case, action must be taken in the minor’s best interest. This is described in the following section, refusal.

Refusal:

- Parent / guardian refuses to give consent for treating their child when the child’s life or limb appears to be at risk.
- Parent / guardian refuses to give consent where child abuse is suspected.
- Suicidal patients – any age.

In all such cases, contact with Medical Control and a Physician is mandatory, as the patient may have a life-threatening problem and is in need of medical care. The involvement of the Police in these situations is often necessary and crucial. They may assist the EMS crew with transport as ordered by the On-line Physician. This is described in the Ohio Revised Code, Section 5122.10.

TRANSPORTATION

Destination Refusal:

There may be EMS calls where the EMS unit is unable to transport patient to their destination of choice. If the competent patient refuses this, and is in stable condition, a private ambulance may be called to take the patient. The responding EMS unit must stand by until the private EMS providers arrive and assume care of the patient.
**Key Points**

- A Patient contact is defined as a request for service where EMS interfaces with the patient directly.
- Calling Online Medical Control is suggested high risk or unstable patients. This is liability protection for all involved and the Physician may be able to communicate additional facts regarding the patient condition to the providers or the patient directly.
- Online Medical Control is always available to EMS, especially in atypical or uncomfortable situations.
- Patients capable of making informed decisions are permitted to refuse, however efforts to have patient assessed further must be attempted for liability protection.
- Documentation of the efforts for additional assessment must be included in the PCR.
- Patient must be able to repeat in their own words risks and must verbalize understanding of consequences.
CRIME SCENE GUIDELINES

This guideline shall be used when law enforcement personnel advise EMS that they have responded to a crime scene, or EMS determines that a crime scene may exist. The purpose is to ensure the protection of the patient welfare as well as to ensure the ability to conduct an effective and through investigation of the crime.

If a provider finds themselves on a known or suspected crime scene;
- Assure safety of all EMS providers
- Summon Law Enforcement if not already present
- Lead EMS provider may request entry of safe area to determine viability of patient
- Additional personnel must be with visual contact
- Summon additional resources to the patient side only as necessary
- Minimize scene disturbances
- Enter and exit on same path
- Do not go anywhere else on the scene except as necessary for patient care
- Wear gloves always
- Avoid pools of blood
- Minimize personnel to only those required for patient care
- Do not cut through knife / bullet holes in clothing
- Do not go through patient’s effects
- If patient is believed to be DOA, one provider to approach and attach cardiac monitor to confirm death
- If patient is believed to be viable, follow appropriate treatment protocol for situation, remove from crime scene as soon as possible and relay any information discovered to Police as soon as possible.

**Known or suspected crime scene**

- Assure safety of all EMS providers
- Summon law enforcement if not already present
- Lead EMS Provider may request entry of safe area to determine viability of patient – Additional personnel must be within visual contact
- Summon additional EMS resources only as absolutely required for patient care

**VIABLE PATIENT**
- Follow appropriate treatment protocol
- Remove from crime scene as soon as possible
- Relay any information regarding crime obtained during treatment to police as soon as possible
- TRANSPORT To facility appropriate for patient condition

**REFUSED ACCESS TO PATIENT**
- REMAIN CLAM
- CONTACT ONLINE MEDICAL CONTROL

**VALIABLE PATIENT**
- Enter and exit scene in the same path
- Do not go any other places within the scene other than what is required for patient care and / or assessment
- Wear gloves always, put on prior to entry and do not remove until after exit
- Avoid pools of blood
- Minimize personnel allowed access to the scene to those who are absolutely required for patient care and / or assessment
- Do not cut clothes through knife or bullet holes

**DECEASED PATIENT**
- Refer to DOA guidelines
- Do not move body
- One provider to apply cardiac monitor to document death
- CONTACT ONLINE MEDICAL CONTROL
- Do not transport DOA

---

**Northeast Ohio Regional EMS Protocol Page 21 | 15**
Some jurisdictions may have special policy on the handling of DOA cases, and, among other points, Online Medical Control may not need to be contacted. Refer to organizational policy in these cases if your department participates.

**PURPOSE**
EMS should not begin to resuscitate if any of the following criteria for death in the field are met for a patient who presents pulseless, apneic and with any one of the following:

- Injury incompatible with life (i.e. decapitated, gross incineration)
- Signs of decomposition, rigor mortis, extreme dependent lividity
- Cardiac arrest, secondary to massive blunt trauma without signs of exsanguination
- Adult: Unwitnessed cardiac arrest >20 minutes, history of absence of vital signs >20 minutes with asystole on the EKG, not secondary to hypothermia or cold-water drowning.
- Ohio DNR Comfort Care order
- Other DNR as validated by on-line physician

**PROCEDURE**
In all cases, contact with Medical Control should be immediate and well documented. Obtaining an EKG of asystole in two leads may be possible in some cases. When the on - line physician states to do nothing, it should be documented as the pronouncement of death. **Once this is done, the police should assume control of the scene, and EMS may go back into service.**

**KEY POINTS**
- If a bystander or first responder has initiated CPR or automated defibrillation prior to an EMS Paramedic’s arrival and any of the above criteria (signs of obvious death) are present, the Paramedic may discontinue CPR and ALS therapy. All other EMS personnel levels must communicate with medical control prior to discontinuation of the resuscitative efforts.
- If doubt exists, start resuscitation immediately. Once resuscitation is initiated, continue resuscitation efforts until either:
  - Resuscitation efforts meet the criteria for implementing the Termination of Resuscitative Efforts Protocol, if valid in the EMS jurisdiction.
  - Patient care responsibilities are transferred to the destination hospital staff.
  - When a Dead-on Arrival (DOA) patient is encountered, the squad members should avoid disturbing the scene or the body as much as possible, unless it is necessary to do so in order to care for and assist other victims. Once it is determined that the victim is, in fact, dead the squad members should move as rapidly as possible to transfer responsibility or management of the scene to the Police Department of EMS should not pronounce enroute.
  - Pregnant patients estimated to be 20 weeks or later in gestation should have standard resuscitation initiated and rapid transport to a facility capable of providing an emergent c-section. Paramedics CANNOT perform a c-section even with Medical Control permission.
  - Victims of lightning strike, drowning, or a mechanism of injury that suggested non-traumatic cause for cardiac arrest should have standard resuscitation initiated.
  - If the patient is pronounced on scene, leave the ETT, IV, and other interventions in place.
What does HIPAA stand for?
- The Health Insurance Portability and Accountability Act. Enacted in 1996, this federal law regulates health insurance and insurance benefit programs.

What is HIPAA’s privacy rule?
- The privacy rule is a set of laws created to protect the privacy of a patient’s health information, including medical records.

Why was HIPAA created?
- Before this rule was created, it was possible for patient information to be easily accessible without the patient’s authorization and for reasons that had nothing to do with medical treatment. For example, a patient’s medical information might be passed to a bank or lender, who might deny or approve a loan requested by the patient.

Who has to follow the rule?
- The privacy rule directly relates to healthcare providers (such as ambulance services, hospitals, physicians, and home health agencies), health plans and insurance companies, and healthcare clearing houses (such as companies that bill for healthcare services).

What if you don’t comply?
- The penalty for one violation is $100, with a limit of $25,000 per year for any single organization that fails to comply with multiple requirements. The authority to impose penalties is carried out by the Department of Health and Human Services. In cases involving grossly flagrant and intentional misuse of patient information, violators may be socked with criminal penalties up to $250,000, ten years in jail, or both - depending on the circumstances.

What should I do at the scene?
- Exercise confidentiality on the scene by:
  - Not sharing information with bystanders.
  - Limiting radio transmissions that identify patients.
  - Avoid disclosure of unnecessary information to police (appropriate info includes patient’s name, DOB, and destination hospital.)
  - Protecting patient’s privacy whenever possible.
  - Don’t volunteer patient medical information with people at the scene.

Hospital Contact and EMS
The relationship of the hospital and EMS are not really affected by HIPAA. The process of Performance Improvement is an important element of patient care that is worked on at each department under Medical Control and then the issues are addressed by the Medical Director during Run Reviews at each station. Information about the patient may be given to the Emergency Department by radio, phone, fax, or electronically. The information is needed for treatment of the patient and becomes part of the medical record.

Following the privacy policy along with common sense regarding your patient’s right will assure that no HIPAA rules are violated.
NEWBORN ABANDONMENT

Ohio law provides that a parent may drop off a newborn baby within the first 30 Days after birth at any law enforcement agency, hospital, or emergency medical service. Should this occur, the first priority is to care for the infant’s health and safety. Notification should then be made to the Public Children’s Services agency for that county. If possible, obtain any medical information that may be available. If it appears that the infant has suffered any type of physical harm, attempts should be made to detain the person who delivered the child.

PURPOSE

To provide:

• Protection to infants that are placed into the custody of EMS under this law
• Protection to EMS systems and personnel when confronted with this issue

PROCEDURE

1. Initiate the Pediatric Assessment Procedure.
2. Initiate other treatment protocols as appropriate.
4. Contact Medical Control as soon as infant is stabilized.
5. Transport infant to medical facility as per local protocol.
6. Assure infant is secured in appropriate child restraint device for transport.
7. Document protocols, procedures, and agency notifications.
MEDICAL CONTROL / PROCEDURES

OBESE PATIENTS

All individuals served by the EMS system will be evaluated, furnished transportation (if indicated) in the most timely and appropriate manner for each individual situation.

PURPOSE
To provide:
- Rapid emergency EMS transport when needed.
- Appropriate medical stabilization and treatment at the scene when necessary.
- Protection of patients, EMS personnel, and citizens from undue risk when possible.

PROCEDURE
1. Each situation may dictate its own procedure for the transport of morbidly obese patients.
2. It is the responsibility of EMS personnel at the scene to provide the most appropriate medical care, including the protection of the patient, EMS personnel, and bystanders, while transporting morbidly obese patients.
3. Utilization of additional resources may be required, at the discretion of the on-scene EMS personnel.

KEY POINTS
In any community there may be one or more individuals who fall into this extreme. As patients, these individuals are frequently classed as high risk because of the increased medical complications associated with their excess weight. In the EMS system they present the additional problem of movement and transportation. These individuals have the right to expect prompt and expert emergency medical care. Therefore, in order to facilitate the care of these individuals without risking the health of EMS workers, the following protocol is established.
- In managing a patient with weight over 300 lbs., at no time should the patient be moved without at least sufficient manpower to assist.
- At the scene, as many EMS personnel as can be mobilized may be supplemented by police or other safety personnel as appropriate. If sufficient manpower is not available, mutual aid may be required.
- It may be necessary to remove doors, walls or windows. The situation is no different than extrication from a vehicle, although property damage may be higher. At all times the patient's life must be the first priority.
- The patient is to be placed on at least 2 (double) backboards or other adequate transfer device for support.
- The patient is to be loaded on a cot that is in the down position, and the cot is to be kept in the down position at all times. Be aware of the cot weight limitations.
- It is necessary to notify the hospital well in advance of arrival so that preparations can be completed in a timely fashion.
- If individuals in the community are known to fall within this special category it is appropriate to inform them in advance of the type of assistance they can expect from the EMS system and help them make plans well in advance to assist you.
- When calling for the squad, and if they identify themselves and their special needs, it will promote the timeliness of your efforts.
ON - SCENE EMT / NURSE / PHYSICIAN INTERVENER

The medical direction of prehospital care at the scene of an emergency is the responsibility of those most appropriately trained in providing such care.

**PURPOSE**
- To identify a chain of command to allow field personnel to adequately care for the patient
- To assure the patient receives the maximum benefit from prehospital care
- To minimize the liability of the EMS system as well as the on - scene Physicians

**PROCEDURE**
1. When a non - Medical Control Physician offers assistance to EMS or the patient is being attended by a Physician with whom they do not have an ongoing patient relationship, EMS personnel must review the On-Scene Physician form with the Physician. All requisite documentation must be verified and the Physician must be approved by on – line Medical Control.
2. When the patient is being attended by a Physician with whom they have an ongoing patient relationship, EMS personnel may follow orders given by the Physician if the orders conform to current EMS guidelines, and if the Physician signs the PCR. Notify Medical Control at the earliest opportunity. Any deviation from local EMS protocols requires the Physician to accompany the patient to the hospital.
3. EMS personnel may accept orders from the patient’s Physician over the phone with the approval of Medical Control. The Paramedic should obtain the specific order and the Physician’s phone number for relay to Medical Control so that Medical Control can discuss any concerns with the Physician directly.

<table>

</tr>
</tbody>
</table>

| **On - Scene Physician:** |
| This is a Physician with no previous relationship to the patient, who is not the patient’s private Physician but is offering assistance in caring for the patient. The following criteria must be met for this Physician to assume any responsibility for the care of the patient: |
| - Ideally, if no further assistance is needed, offer should be declined. |
| - Medical Control must be informed and give approval. Encourage Physician to Physician contact. |
| - The physician must have proof they are a Physician. They should be able to show you their medical license. Notation of Physician name, address and license numbers must be documented on the run report. |
| - The Physician should have expertise in the medical field for which the patient is being treated. |
| - The Physician must be willing to assume responsibility for the patient until relieved by another Physician, usually at the Emergency Department. |
| - The Physician must not require the EMT to perform any procedures or institute any treatment that would vary from protocol and / or procedure. |
| - If the Physician is not willing or able to comply with all the above requirements, his / her assistance must be declined. |

| **On - Scene Personal Care Physician:** |
| This is a Physician with a current relationship to the patient, who is offering assistance in caring for the patient. The following criteria must be met for this Physician to assume further responsibility for the care of the patient: |
| - EMS should perform its duties as usual under the supervision of Medical Control or by protocol. |
| - Physician to ED Physician contact is optimal. |
| - The Physician may elect to treat the patient in his office. |
| - EMS should not provide any treatment under the Physician's direction that varies from protocol. If asked, EMS should decline until contact is made with Medical Control. |
| - Once the patient has been transferred into the squad, the patient's care comes under Medical Control. |
MEDICAL CONTROL / PROCEDURES

SCHOOL BUS ACCIDENTS

PURPOSE:

Provide treatment / transport guidelines for on scene providers when faced with incidents involving school buses

PROCEDURE:

- Check with the school district regarding their specific school bus response polices
- School administrators are responsible for the students; a school administrator should be requested to the scene as soon as possible.
- Administrators may take the children back to the school in another bus or school vehicle; they may arrange for transportation back to the home or have the student parents pick them up at school.
- Children should be cleared from the scene as safely and as quickly as possible.
- ANY injury should be transported to the nearest most appropriate emergency department and the parents notified.
- EMS responders must be prepared to enact mass casualty protocols in the event of any serious school bus accident.
- If school administrators accept responsibility for the non-injured children as per their bus accident protocols / policies, then individual releases are not required.
- If for whatever reason there is no school administrator on scene, EMS providers must take responsibility for all children until school administrators arrive.
- If there will be a significant delay in the arrival of school administrators, and the accident is minor, the bus should be directed to return to the school or to a safe area out of traffic.
- Notification of the number and types of injuries should be communicated with the receiving facilities in the event of transportation of injured students to the receiving facilities as early as possible.
MEDICAL CONTROL / PROCEDURES

TERMINATION OF RESUSCITATIVE EFFORTS

ADULT Patient is in Cardiac Arrest

Evidence of DOA

DNR Patient

20 Minutes of On Scene Cardiac Arrest Care

Cardiac Arrest Treatment Per Cardiac Arrest Protocol(s) Appropriate for Level of Certification and Scope of Practice

Consider Field Termination if no ROSC

Non-EMS Witnessed Arrest

20 Minutes of Cardiac Arrest Care

Non-Shockable Rhythm

Contact Medical Control if Considering Field Termination

DOA Protocol

DNR Protocol

Special Cases - Transport with Arrest Management in Place

Hypothermia

Maternal Arrest

If EMS Witnessed Arrest – Work on scene and Transport with or without ROSC

PURPOSE
The purpose of this policy is to:

- Allow for discontinuation of prehospital resuscitation after delivery of adequate and appropriate therapy.
- EACH PATIENT SHOULD BE EVALUATED ON A CASE-BY-CASE BASIS

INDICATIONS
When a patient that is in cardiac arrest has failed to resuscitative efforts, it may be decided to terminate the effort and not transport the patient to the hospital. When the EMS provider determines that this option is appropriate, the following criteria must be met:

FOR BLS Providers
1. The victim is 18 years or older.
2. Cardiac arrest must not have been witnessed by EMS or first responders.
3. NO ROSC have been achieved after 20 minutes of CPR.
4. The cardiac rhythm is non-shockable.

FOR ALS Providers
1. The victim is 18 years or older.
2. The victim must be in asystole in two leads and have the absence of a pulse confirmed.
3. The victim must not be in arrest due to hypothermia, or apparent drug overdose.
4. The victim must have a properly placed advanced airway.
5. The patient must have a patent IV / IO access.
6. At least two rounds of ACLS drugs have been administered.
7. At least 20 minutes of resuscitation has been performed.
8. Medical control must be contacted - the physician must speak directly with the paramedic. Then the physician and paramedic must agree on the termination of efforts. The physician must give consent for the resuscitation effort to cease.

An intra-arrest capnography reading <10 indicates no perfusion and may be helpful in considering termination or efforts.

Do not remove endotracheal tubes, IV’s, etc.
Document Medical Control Doctors name and time of termination / death on PCR
Ohio law provides for the welfare and protection of EMS and other Emergency Care Workers (ECW) in two separate sections of the Ohio Revised Code:

- If there has been either an Airborne or Bloodborne exposure to the ECW, every hospital must have a policy to follow-up appropriately. This may include testing of the patient source and the ECW. **It is important to report the exposure, so the patient source can be tested at the facility where the patient has been transported.**

- The second section establishes the obligation of the hospital, once a patient has been diagnosed with a communicable disease, to find out if there was any exposure during transport of the patient.

All possible exposures must be documented both at the hospital and at the place of employment. Various forms must be completed.

**STANDARD PRECAUTIONS**

Emergency Care Workers are to consider **ALL** patients as potentially infected with a communicable disease and are to adhere **RIGOROUSLY** to Infection Control precautions for minimizing the risk of exposure to blood and body fluids of **ALL** patients.

**Guidelines:**
1. Wear gloves **ALWAYS**.
2. **ALWAYS** Wear gloves, mask, and goggles when performing Airway Maneuvers such as Bagging, King Insertion, Intubation, and Suctioning.
3. Wear apron, jumpsuit or other coverall when exposed to large amounts of blood or body fluids.
4. For **Airborne Communicable Diseases**, care must be taken to wear the proper mask, ventilate the squad, and limit exposure of EMS personnel as much as possible. If a patient has fever, cough or rash, a mask is a good idea.
5. Maintain good handwashing practices after removing gloves.
6. Obtain Hepatitis B Vaccination and other testing and vaccines as recommended.
7. Handle "Sharps" carefully - dispose of properly.
8. Wear personal protective gear when **CLEANING** contaminated equipment.
9. Dispose of contaminated waste, equipment and clothing carefully and properly

Report EXPOSURES immediately and at location of patient transport.

Document and follow up properly.

**Contact your Medical Control for Exposure control Policy and Exposure forms**
MEDICAL CONTROL / INFECTION CONTROL

INFECTION CONTROL / EXPOSURE POLICY GUIDELINES

Purpose
It is reasonably anticipated that any operation, including fires, Haz-mat, extrication, MVA’s etc. may involve exposure to blood, body fluids or other potentially infectious material. The health and welfare of everyone is the responsibility of each department (where employed), however it is recognized the need to offer guidance to minimize each individual’s risk of exposure to communicable diseases during all aspects of care. This comprehensive program will provide individuals with education, immunization and personal protective equipment to minimize exposure to blood borne pathogens and/or communicable diseases. The major areas of exposure control encompass:

- Standard Precautions
- Engineering Controls
- Work Practice Controls
- Hand Hygiene
- Personal Protective Equipment
- Cleaning Procedures
- Hepatitis B vaccination
- Training regarding infection prevention and control will occur upon hire, yearly & as needed.

Standard Precautions
The blood and body fluids/substances of ALL patients are be treated as potentially infectious, regardless of diagnosis (or before diagnoses is determined in the case of prehospital care). Appropriate barrier precautions (i.e., gloves, gowns, masks, and goggles) must be routinely and consistently used for contact with blood and body fluids/substance, mucous membranes and non-intact skin of ALL patients.

Engineering controls
The following engineering controls are available to hospital care providers:
- Hand Hygiene methods (soap & water – sinks &/or hand sanitizers in rescue vehicles)
- Sharps containers are available at point of use – they are puncture resistant and leak proof
- Sharps safety devices are available for venipuncture devices, syringes and lancets
- Exposure from failed engineering controls must be reported to allow review of incident and follow-up.

Patient Care Equipment Cleaning
- Patient care equipment will be cleaned on a daily, weekly or monthly schedule as determined by individual EMS department.
- EMS will follow any additional recommendations for decontamination given by Medical Direction Infection Control Department, Cuyahoga County Board of Health, Ohio Dept. of Health and/or Centers for Disease Control.

General Requirements
- Hand hygiene is routinely and consistently performed (methods are described below).
- Avoid touching eyes, nose, or mouth while giving patient care or handling contaminated
Hand Hygiene
Hand hygiene is the single most important means of preventing the spread of infection. Hand hygiene includes “washing” with soap and water or “sanitizing” with alcohol-based hand rub.

Wash with soap and water (scrub together, at least 15 seconds) in the following situations:
- On your arrival to work
- When hands are visibly soiled (dirty)
- When hands are visibly contaminated with blood or body fluids
• Before eating or after using the bathroom
• Before preparing, handling or serving food
• On completion of duty before going home

Sanitize with an alcohol hand rub in the following situations: (soap & water may also be used)

• Before and after having direct contact with patients (taking BP, pulse or lifting a patient)
• Before inserting indwelling catheters, peripheral vascular catheters or other invasive devices not requiring a surgical procedure
• Before donning sterile gloves when inserting a central intravascular device
• After contact with body fluids or excretions, mucous membranes, non-intact skin and wound dressings if hands are not visibly soiled
• If moving from a contaminated body site to a clean body site
• After contact with inanimate, environmental objects (including medical equipment) in the immediate vicinity of the patient
• After removing personal protective equipment (i.e. gloves, gowns, masks)
• After sneezing, coughing, or blowing your nose
• Alcohol hand rub is available in all rescue vehicles

Personal Protective Equipment
Occupational exposure may remain after engineering and work control practices have been implemented, requiring the use of personal protective equipment (PPE). PPE is a barrier that prevents blood or other infectious materials from passing through to skin and/or clothing underneath. These barriers include but are not limited to single use gloves, disposable gowns, face shields/masks, and protective eyewear. Individuals must anticipate the type of exposure that may occur during each patient contact and wear the appropriate PPE to prevent an exposure to blood and/or other potentially infectious body fluids. Although each situation will be different, below are general guidelines to consider for PPE:

Gloves
• Gloves should be worn for all EMS runs.
• Gloves shall be replaced as soon as possible when soiled, torn, or punctured.
• “Disposable gloves” are single patient use only, carefully remove by turning gloves inside out and disposing in the trash
• “Structural firefighting gloves” shall be worn in situations where sharp or rough edges are likely to be encountered. If contaminated, gloves must be washed before being re-used.
• “Heavy-duty utility gloves” may be used for handling, cleaning, or decontamination of equipment.
• Wash hands immediately after glove removal.

Gowns/Shoes/Head Covers
Fluid resistant disposable gowns are worn when it is anticipated that clothing may be soiled by blood or body fluids during the performance of a task or procedure. Under certain circumstances, head covers and/or shoe covers will be required to protect these areas from potential contamination. The goal is to protect the employee and their clothing from becoming contaminated. Structural firefighting gear may be substituted to protect clothing from splashes and preferable in fire, rescue or vehicle extrication activities. Disposable, paper gowns may interfere with or present a hazard to the individual in these circumstances. The decision of what type of barrier protection to use to protect clothing will be left to the individual. If disposable gowns are used:
• Shoe and head cover and gowns are single patient use and only removed immediately after use.
• They should be rolled/folded with contaminated surface inside and disposed in the trash.

**Mask / Eye / Mouth Protection**

Masks and/or eye protection must be used whenever a reasonable potential for splashing or aerosolization of blood or body fluids to the eyes, nose or mouth exists. Face shields on structural firefighting helmets are not adequate for infection control purposes. When treating a patient with known or suspected droplet transmissible disease (i.e. seasonal influenza, meningitis), a surgical mask must be worn if you anticipate being within 3 feet of the patient.

When treating a patient with known or suspected airborne transmissible disease (i.e. TB, Avian Flu), N95 face masks must be used. If possible have the patient wear a surgical mask. (Also, notify the ED of need for isolation as they will need to prepare a negative pressure room for the patient.)

In times of limited supplies of N95 masks, masks can be re-used by the same person unless wet, dirty or torn. Place disposable surgical mask over N95 to prevent external contamination and extend use.

**After removal of PPE**

Upon returning to quarters, wash grossly contaminated uniforms in hot water with washer provided by department. If washer is being used, place clothing into biohazard bag and wash A.S.A.P.

• Under no circumstance should grossly contaminated clothing be removed from the station without being washed.
• After any contact with contaminated item perform hand hygiene. (wash or sanitize hands) No living area may be entered by personnel if clothes are contaminated.
• The individual shall shower if body fluids were in contact with skin under work clothes.
• All individuals shall have (2) complete changes of uniform clothing.
• Per NFPA 1971 contaminated structural firefighting gear shall be cleaned according to the manufacturer’s recommendations found on attached labels. (i.e. gloves, boots, turnoutcoats, bunker pants.)

**Expanded Precautions**

Expanded precautions are designed for patients documented or suspected to be infected with highly transmissible or epidemiologically important pathogens spread by airborne or droplet transmission or by contact with the patient or contaminated surfaces. It is felt that precautions beyond Standard Precautions are necessary or may be helpful to interrupt transmission in health care settings both pre-hospital and in the health center.

These precautions are to be used in addition to Standard Precautions.
### EXPANDED PRECAUTION TYPE | PRE-HOSPITAL IMPLEMENTATION
---|---
**CONTACT PRECAUTIONS (Green)** | Gloves worn by everyone providing care and/or handling patient care equipment. Gowns required for anyone having direct contact with patient or patient environment. Wash hands with soap and water after care. DO NOT use alcohol hand rub (sanitizer)

**DROPLET PRECAUTIONS (Orange)** | Surgical mask required if you are within 3 feet of the patient. AND Surgical mask on patient during transport.

**AIRBORNE PRECAUTIONS (Pink)** | N95 mask for everyone providing care. AND Turn on exhaust fan in transporting vehicle AND Surgical mask on patient during transport.

**COMPROMISED PATIENT (White)** | Frequent, meticulous hand hygiene. Associates with active infections such as colds, herpes virus, upper respiratory illness, diarrhea, or other infectious diseases must have no contact with the patient. If this is unavoidable, they must wear a mask or other appropriate barriers.

### Preparedness

Routine surveillance may detect an individual who requires “Expanded Precautions” such as a person being transported with possible Tuberculosis, Clostridium Difficile, or MRSA (Methicillin Resistant Staphylococcus Aureus). This is handled with routine procedures. Some patient presentations may require extraordinary procedures such as implementation of internal, external or hazmat disaster plans at the health center. This may be for suspected cases of SARS, Avian Flu, Bioterrorism, etc....or for clusters of unusual infectious diseases being identified. EMS will notify the ED of suspected cases that may require the health center to implement their Emergency Management Plans. If this happens, “PPE” (Personal Protective Equipment) may be added to the disaster phase if it is implemented.
Examples of situations that may require activation of disaster plans (Internal/External/Hazmat) and PPE is announced with the Disaster Phase:

</table>
Ohio Senate Bill 58 became Law in September 2010.

The Law includes provisions for EMS providers to withdraw blood for evidence collection in cases involving allegations of operating watercraft or vehicles under the influence.

The language of the bill states that drawing blood “may” not “shall” be done for evidence collection “in the course of” providing emergency medical treatment.

- You CANNOT be dispatched or called by the police for the sole purpose of performing phlebotomy when the person does not require emergency medical treatment.

- The Medic/AEMT in charge can refuse law enforcements request to draw the blood if doing so would interfere with lifesaving patient care or outcome.

- The patient must consent to the collection of blood for evidence purposes. (If unconscious, Implied Consent applies)

- The Police Officer making the request must always be present during the draw and must provide the Medic/AEMT with the evidence collection kit.

- EMS Providers MUST use the evidence kit provided by law enforcement to obtain the blood samples for evidence.
**PURPOSE**

- To allow equipment supplied by individual EMS departments, but not specifically referenced in EMS protocol to be used for the benefit of patient care.
- Define the process of Medical Director review and approval of EMS Department supplied patient care equipment
- Define where and who is responsible for the Operating Procedures for EMS department supplied patient care devices.

**POLICY**

It is understood that EMS departments may have equipment that is not necessarily referenced in this EMS protocol. For these items to be used within the scope of University Hospitals EMS Medical Direction and as an adjunct to these EMS protocols the following must occur.

1. The device must be approved by the Medical Director in writing.
2. The Department must develop, implement, and periodically review operating procedures for the device. These will become the protocol for the use of the referenced device. The operating procedure must include indications, contra-indications, instructions for use, approved levels of EMS certification, signs and symptoms, key points, outline training requirements, and define maintenance (if applicable). The operating procedures must be approved and signed by the Medical Director.
3. The Department must be willing to incur all costs associated with operating said device, including disposable items.
4. The Department must provide training on the device to all department members expected to use the device under the direction and approval of the Medical Director
5. The Department must be willing to share performance data on the device with the University Hospitals EMS Medical Direction, including Patient Care Reports, within the scope of HIPAA.
6. The Department must report adverse patient outcomes that may be attributed to the patient care device as soon as identified.
7. The Department must agree to discontinue use of the device on the instruction of the Medical Director.
There are several methods of EMS drug exchange. Medications may be managed by the Medical Control hospital, or some agencies may purchase their own medications. Refer to individual hospital or agency rules regarding management of medications. Any method of medication management and restocking must be consistent with all federal, state, and local laws, rules, and regulations.
APPENDIX #4: ODPS EMS SCOPE OF PRACTICE

Scope of Practice Introduction ...............................................................................................................2-16
Procedure Matrix .................................................................................................................................3-16
EMS Care of Cats and Dogs .................................................................................................................10-16
Pre-Existing Medical Devices ..............................................................................................................11-16
Interfacility Transport ..........................................................................................................................13-16
Transmission of 12 Lead EKG’s .........................................................................................................15-16
This document offers an “at-a-glance” view of the Scope of Practice for Emergency Medical Responders (EMR), Emergency Medical Technicians (EMT), Advanced Emergency Medical Technicians (AEMT), and Paramedics as approved by the State Board of Emergency Medical, Fire, and Transportation Services (EMFTS Board). The authorized services can be found in sections 4765.35 (FR/EMR), 4765.37 (EMT-B/EMT), 4765.38 (EMT- I/AEMT), and 4765.39 (EMT-P/Paramedic) of the Revised Code. The scopes of practice can be found in rules 4765-12-04 (EMR), 4765-15-04 (EMT), 4765-16-04 (AEMT), and 4765-17-03 (Paramedic) of the Administrative Code. The Ohio EMS scope of practice authorized by the EMFTS Board applies to emergency and non-emergency settings.

Performance of services outlined in this document and in the aforementioned code sections, shall only be performed if the EMR, EMT, AEMT, and Paramedic have received training as part of an initial certification course or through subsequent training approved by the EMFTS Board. If specific training has not been specified by the EMFTS Board, the EMR, EMT, AEMT, and Paramedic must have received training regarding such services approved by the local medical director before performing those services.

The individual medical director of each EMS agency may limit or ask that providers obtain approval from medical direction for certain treatments. Each medical director may need to tailor and revise their protocol to meet their community’s needs and to fit their region and individual practice, but they must ensure that all protocols remain within the approved scope of practice. EMS medical directors are reminded that they are not permitted to expand or exceed the scope of practice for EMS providers which has been authorized by the EMFTS Board; however, they may provide clarifications or limitations on services that are permitted.

EMS medical directors and EMS providers are strongly encouraged to review the EMFTS Board’s policy statement “Regarding EMS Provider Prehospital Transport of Patients with Pre-Existing Medical Devices or Drug Administrations” dated February 2018 (attached at the end of this document). This statement clarifies how EMS providers, in the prehospital setting, should deal with medical devices and medicine administrations that are outside their scope of practice.

Pursuant to rule 4765-6-04 of the Administrative Code, the EMFTS Board may allow EMRs, EMTs, AEMTs, and Paramedics to perform services beyond their respective scopes of practices as part of a board-approved research study. An entity must submit a research proposal to the EMFTS Board in accordance with the requirements of rule 4765-6-04 of the Administrative Code. The EMFTS Board is not obligated to approve the proposed research study nor accept any recommendation to permanently amend the scope of practice.

### Emergency Medical Services in Hospital

In a hospital, an EMT, AEMT or Paramedic may perform emergency medical services in accordance with the following conditions: only in the hospital’s emergency department (ED) or while moving a patient between the ED and another part of the hospital; only under the direction and supervision of a physician, a physician assistant designated by a physician, or a RN designated by a physician (ORC 4765.36). The EMT, AEMT, or Paramedic cannot perform any service outside the scope of practice of his or her certificate to practice.

### Additional Services in a Declared Emergency

In the event of an emergency declared by the governor that affects the public’s health, an EMS provider may perform immunizations and administer drugs or dangerous drugs, in relation to the emergency, provided the EMS provider is
under physician medical direction and has received appropriate training regarding the administration of such immunizations and/or drugs. (OAC 4765-6-03)

A certified AEMT may administer oral ondansetron for patients age 12 years or older.

The approved route of administration of any specific medication is stated in the respective EMT, AEMT, and Paramedic curriculum. The EMS provider shall administer medications only via the route addressed in each respective curriculum and consistent with their level of training.
The approved route of administration of any specific medication is stated in the respective EMT, AEMT, and Paramedic curriculum. The EMS provider shall administer medications only via the route addressed in each respective curriculum and consistent with their level of training.

EMS Care to Dogs and Cats
House Bill 187 was signed by the Governor on May 31, 2016 and becomes effective on August 31, 2016. This legislation establishes Ohio Revised Code 4765.52, which permits EMS certificate holders to provide care to dogs and cats within the following guidelines.

• The law applies to all EMS certificate holders (EMR, EMT, AEMT, Paramedic).

• Only dogs and cats are referenced in the Bill. The law does not authorize care to any other animals.

• Medical care for dogs and cats should only be performed in the course of an emergency medical response, fire response, or response to aid law enforcement. The law does not apply to a call for EMS care for animals and, furthermore, does not require EMS organizations to respond to calls for animal assistance.

• The scope of practice is not expanded for care to animals. The certificate holder is only authorized to perform the corresponding form of medical services that could be provided to a human patient including:
  - Opening and manually maintaining an airway;
  - Giving mouth to snout or mouth to barrier ventilation;
  - Administering oxygen;
  - Managing ventilation by mask;
  - Controlling hemorrhage with direct pressure;
  - Immobilizing fractures;
  - Bandaging;
  - Administering Naloxone if administering Naloxone has been authorized by the medical director and the drug is administered either in accordance with a written protocol established by a veterinarian or pursuant to consultation with a veterinarian.

• Immunity applies to EMS certificate holders when providing care to dogs and cats under the same circumstances as when providing care to human patients.

• Veterinarians who assist EMS certificate holders with medical services to a dog or cat have the same level of immunity as medical directors who assist with EMS matters.

This document has been prepared for informational purposes only. As always, certificate holders and EMSOs should consult with their legal counsel for advice.
The State Board of Emergency Medical, Fire, and Transportation Services (“EMFTS Board”) issues the following statement:

Regarding EMS Provider Prehospital Transport of Patients with Pre-Existing Medical Devices or Drug Administrations
February 2018

This statement is an attempt to provide general information about the above issue facing EMS providers. It should not be treated as legal advice or medical direction. For direct advice regarding a particular scenario, please consult with your medical director and legal counsel. Although the following statement represents the EMFTS Board’s general position on the above issue, this statement in no way precludes the EMFTS Board from taking disciplinary action in a particular case if necessary. Any potential complaints brought before the EMFTS Board will be decided on a case-by-case basis.

Introduction:
The EMFTS Board and the Ohio Department of Public Safety, Division of Emergency Medical Services, has developed a defined scope of practice for EMS providers. It is maintained in matrix form and available online as a reference for public access. This scope of practice addresses all levels of EMS providers and has been approved by the EMFTS Board. Updates to the scope of practice are made as necessary and after approval by the EMFTS Board.

From time to time, EMS providers are confronted on-scene with patients with preexisting medical situations not included or addressed in their respective EMFTS Board approved scope of practice. Specifically, patients with pre-existing medical devices and drug administrations requiring prehospital EMS service are becoming more commonplace. The intent of this position paper is to address the EMS provider’s approach to that prehospital patient with a pre-existing physician-ordered medical device or drug administration (“MDDA”) not covered in the provider’s scope of practice.

Discussion:
In general, the EMS provider should maintain the pre-existing MDDA and transport the patient to the appropriate facility. There is no expectation that the EMS provider will initiate, adjust, or discontinue the pre-existing MDDA. This implies that the EMS provider will maintain and continue care so that the patient can be transported.

The EMS provider is expected to follow local protocols regarding the overall evaluation, treatment, and transportation of this type of prehospital patient requiring EMS service. It applies to EMS provider situations where alternative transportation and care is not available or practical (prehospital or “911 scene response”). It implies that the most appropriate and available level of EMS provider will respond to the request for prehospital EMS service. It also implies that the patient requires the pre-existing MDDA and it is not feasible or appropriate to transport the patient without the pre-existing MDDA.

The number and type of pre-existing MDDAs currently or potentially encountered by the EMS provider in the community setting is extensive and may change frequently. The intent of this position paper is not to provide an inclusive list of pre-existing MDDAs. However, as a guideline for the EMS provider, current pre-existing MDDAs may include ventilatory adjuncts (CPAP, BiPAP), continuous or intermittent IV medication infusions...
(analgesics, antibiotics, chemotherapeutic agents, vaspressors, cardiac drugs), continuous gastric or parenteral infusion of nutrition, and nontraditional out-of-hospital drug infusion routes (subcutaneous infusaports, central venous access lines, direct subcutaneous infusions, self-contained implanted pumps).

**Conclusion:**
In conclusion, the EMS provider confronted with a prehospital patient with a pre-existing physician-ordered medical device or drug administration not covered in the EMS provider’s respective scope of practice should provide usual care and transportation while maintaining the pre-existing MDDA, if applicable. Concerns or questions regarding real-time events associated with a pre-existing MDDA should be directed to the relevant physician providing medical direction. Concerns or questions regarding previous, recurrent, or future prehospital transportations with a pre-existing MDDA should be directed to the appropriate EMS medical director and legal counsel.
The State Board of Emergency Medical, Fire, and Transportation Services (“EMFTS Board”) issues the following statement:

Regarding Interfacility Transport of Patients by EMS Providers and the Scope of Practice
June 2018

This statement is an attempt to provide general information about the above issue facing EMS providers. It should not be treated as legal advice or medical direction. For direct advice regarding a particular scenario, please consult with your medical director and legal counsel. Although the following statement represents the EMFTS Board’s general position on the above issue, this statement in no way precludes the EMFTS Board from taking disciplinary action in a particular case if necessary. Any potential complaints brought before the EMFTS Board will be decided on a case-by-case basis.

Introduction:
The State Board of Emergency Medical, Fire, and Transportation Services and the Ohio Department of Public Safety, Division of Emergency Medical Services, have developed a defined scope of practice for all EMS providers. The scope of practice for emergency medical technicians (EMTs), advanced emergency medical technicians (AEMTs), and Paramedics is established respectively in Ohio Administrative Code Chapters 4765-15, 4765-16, and 4765-17. An outline of the Ohio EMS scope of practice is available in a matrix form and is posted on the Ohio Department of Public Safety, Division of EMS’ website as a reference for public access. This scope of practice addresses all levels of EMS providers and has been approved by the EMFTS Board. Updates to the scope of practice are made as necessary and must be approved by the EMFTS Board.

From time to time, during interfacility transport, EMS providers are confronted with medications, interventions, and therapies that are beyond of their routine scope of practice and training. In these scenarios, additional training (particularly for the Paramedic) paired with initial and ongoing demonstration or testing of skills, is required. The intent of this position paper is to address the approach of the EMS providers and their medical directors to these situations which are not explicitly covered in the Ohio EMS scope of practice.

Discussion:
The number and type of medications, interventions, and therapies in the medical field currently or potentially encountered by the EMS provider in the interfacility transport setting are extensive and may change frequently. The intent of this position paper is not to provide an inclusive or exclusive list of medications, interventions, and therapies that should be included or excluded from the EMS provider’s scope of practice. Rather, the intention of this document is to frame the discussion around maintenance of patient safety during interfacility transport and provision of patient care that is appropriate to the EMS provider’s level of training, including additional training that has been approved and documented by the medical director and completed well in advance of the transfer.

Additionally, the success of any EMS service requires robust medical direction from an actively involved physician who meets the requirements set forth in Ohio Administrative Code 4765-3-05. This includes, but is not limited to, the initial and ongoing training of EMS providers, as well as an active performance improvement process in which all transports are subject to review for quality assurance.

The scope of this document includes all transports in which the highest level of training of the personnel in the transport vehicle is a Paramedic, including transports that require additional training. A mobile intensive care unit, as legislated in Ohio Revised Code 4766.01, is qualified to transport patients whose conditions require care beyond the scope of practice of a Paramedic. A mobile intensive care unit requires the inclusion of a registered
nurse or other allied health professional as cited in Ohio Administrative Code 4766-4-12 and a transport vehicle that has the vehicle specifications and required equipment cited in Ohio Revised Code 4766.07 and Ohio Administrative Code 4766-4-08.

**Conclusion:**
All authorized services provided by certified Ohio EMS providers, which are cited in Ohio Revised Code 4765 and Ohio Administrative Code 4765, require a written protocol from the medical director. The EMT, AEMT, and Paramedic certification is limited to the scope of practice that is set forth respectively in Ohio Administrative Code Chapters 4765-15, 4765-16, and 4765-17. Furthermore, this position paper does not provide an inclusive or exclusive list of medications, interventions, and therapies that should be included or excluded from the EMS provider’s scope of practice. Patient care or services provided that are beyond the routine practice of the certified Ohio EMS provider require additional training that has been approved and documented by the medical director. All additional training must be completed well in advance of the patient transfer and should be paired with initial and ongoing demonstration or testing of skills as an adjunct to support competency.

Prior to accepting a patient for interfacility transportation, the EMS provider:

- Shall complete training for all services provided, including the management of medical equipment and devices, well in advance of the patient transfer, and any additional training must be approved and documented by the medical director.
- Shall complete training for all medications administered, including indications, contraindications, pharmacology, and side effects, well in advance of the patient transfer, and any additional training must be approved and documented by the medical director.

In addition, during the interfacility transportation of patients, the EMS provider:

- Shall follow written protocols, which have been developed and signed by the EMS provider’s medical director.
- Shall not initiate the infusion of blood or blood products including the initiation of infusion of additional units. Under the current scope of practice, the Paramedic may only maintain the infusion of blood or blood products.
- Shall not initiate the infusion of intravenous parenteral nutrition including the initiation of infusion of additional units. Under the current scope of practice, the Paramedic may only maintain the infusion of intravenous parenteral nutrition.
- Shall not initiate or continue the infusion of chemotherapeutic agents.
- Should refuse to initiate a transport if the EMS provider feels that adequate training on a specific medication, intervention, or therapy has not been provided well in advance of the transfer as outlined above or if the EMS provider feels uncomfortable with the transport for any reason, including but not exclusive to safety reasons, patient scenario, or any requested parameter of patient care delivery ordered during patient transport.

Concerns or questions regarding specific interfacility transports should be directed to the Ohio Department of Public Safety, Division of Emergency Medical Services.

RE: Electronic transmission of 12-lead EKGs and the Ohio EMS scope of practice

On August 18, 2015, the Emergency Medical Services, Fire, and Transportation Services (EMFTS) Board approved a position statement regarding electronic technologies and the impact on EMS. For EMS agencies who wish to implement policies and procedures for the use of electronic technology for the transmission of data and images, this will provide additional options for the modes of transmission of prehospital 12-lead electrocardiograms (EKGs), and in some cases, cardiac monitor strips, by Ohio EMS providers.

At the time when the rules addressing the performance and transmission of prehospital 12-lead EKGs were promulgated, the majority of cellular phones lacked camera and internet capabilities, and the primary mode for transmission of a 12-lead EKG to a receiving facility was by telemetry. With the expanded modalities that are cited in the EMFTS Board position paper as inclusive in the definition of electronic transmission, it is important to reinforce the fact that the primary goal of the acquisition of a prehospital 12-lead EKG is to rapidly activate a cardiac catheterization laboratory when a patient experiencing an acute ST-segment myocardial infarction is identified.

The ability to transmit the image of an EKG or a cardiac monitor strip as a digital image via telemedicine avenues or via a cellular phone does not alter the Ohio EMS scope of practice. Regardless of an EMS agency’s policies and procedures to utilize electronic technologies or the protocols provided by the EMS medical director, Ohio EMS providers may not exceed the Ohio EMS scope of practice for their respective level of Ohio EMS certification.

As a review, please note the following key information regarding cardiac monitoring and 12-lead EKG acquisition:

1. The Ohio EMS scope of practice permits Emergency Medical Technicians (EMTs) and Advanced Emergency Medical Technicians (AEMTs) to set up and apply a 12-lead EKG when assisting a Paramedic or for the purposes of electronic transmission if all of the following conditions are met:
   A. The EKG is performed in accordance with a written protocol
   B. The EMT and the AEMT shall not interpret the EKG
   C. Delay in patient transport is minimized
   D. The EKG is used in conjunction with destination protocols approved by the local medical director

Mission Statement
"to save lives, reduce injuries and economic loss, to administer Ohio’s motor vehicle laws and to preserve the safety and well being of all citizens with the most cost-effective and service-oriented methods available."
2. The Ohio EMS scope of practice does not permit EMTs to set up a cardiac monitor unless an AEMT or a Paramedic is present. The EMT shall not perform cardiac monitor interpretation.

Due to the Ohio EMS scope of practice for EMTs and AEMTs, the EMFTS Board continues to strongly recommend the inactivation of the automated interpretation function that is installed in many 12-lead EKG machines and/or the blockade of the printing of the interpretation when the EKG is acquired by an EMT or by an AEMT in the absence of a Paramedic. This action has three benefits:

A. The lack of an automated 12-lead EKG interpretation prevents the EMT and the AEMT from exceeding the Ohio EMS scope of practice.
B. The EMT and the AEMT will avoid the scenario where a patient experiencing chest pain refuses prehospital care and/or transport due to a “normal” automated 12-lead EKG interpretation.
C. Automated interpretations should not be used and are not intended to serve as a substitute for the primary interpretation of a 12-lead EKG by a Paramedic or other medical professional whose training and scope of practice includes 12-lead EKG interpretation.
